   - If the purity level of R-134a or R-12 is 98% or greater by weight, the green "PASS" light emitting diode (LED) will light. The weight concentrations of R-134a, R-12, R-22, hydrocarbons, and air will be displayed on the digital display.
   - If refrigerants R-134a or R-12 do not meet the 98% purity levels, the red "FAIL" LED will light and a horn will sound alerting the user of potential hazards. The weight concentrations of R-134a, R-12, R-22, and hydrocarbons will be displayed on the digital display.
   - If hydrocarbon concentrations are 2% or greater by weight, the red "FAIL" LED will light, "Hydrocarbon High" will be displayed on the digital display, and a horn will sound alerting the user of potential hazards. The weight concentrations of R-134a, R-12, R-22, and hydrocarbons will also be displayed on the digital display.

3. The percentage of air contained in the sample will be displayed if the R-134a or R-12 content is 98% or greater. The diagnostic tool eliminates the effect of air when determining the refrigerant sample content because air is not considered a contaminant, although air can affect A/C system performance. When the diagnostic tool has determined that a refrigerant source is pure (R-134a or R-12 is 98% or greater by weight) and air concentration levels are 2% or greater by weight, the diagnostic tool will prompt the user if an air purge is desired.

4. If contaminated refrigerant is detected, repeat the refrigerant identification test to verify that the refrigerant is indeed contaminated.

5. ⚠ **CAUTION: If contaminated refrigerant is detected, DO NOT recover the refrigerant into R-134a or R-12 recovery/recycling equipment.**

   Recover any contaminated refrigerant using suitable recovery-only equipment designed for capturing and storing contaminated refrigerant. For additional information, refer to Contaminated Refrigerant Handling in this section.

Contaminated Refrigerant Handling

Printable View (11 KB)

1. **CAUTION: If contaminated refrigerant is detected, DO NOT recover the refrigerant into your recovery/recycling equipment.**

   Recover the contaminated refrigerant using suitable recovery-only equipment designed for capturing and storing contaminated refrigerant.

   - This equipment must only be used to recover contaminated refrigerant to prevent the spread to other vehicles.
   - If this equipment is not available, contact an A/C repair facility in your area with the correct equipment to carry out this repair.

2. Determine and correct the cause of the customer's initial concern.

3. **NOTE:** Residual refrigerant oil in the receiver drier must be drained and measured for correct oil system matching. For additional information, refer to Refrigerant Oil Adding in this section.

   NOTE: The receiver drier cannot be cleaned and a new receiver drier must be installed.

   Remove the receiver drier. For additional information, refer to Receiver Drier in this section.

4. Clean the A/C evaporator core and the A/C condenser core by flushing. For additional information, refer to Air Conditioning (A/C) System Flushing in this section.

5. Install the new receiver drier. For additional information, refer to Receiver Drier in this section.

6. Correctly oil match the system. For additional information, refer to Refrigerant Oil Adding in this section.

7. Evacuate and charge the system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

8. Dispose of contaminated refrigerant according to all federal, state and local regulations.

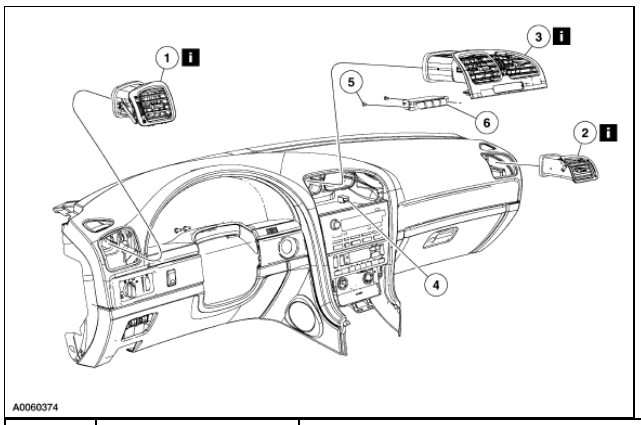
Instrument Panel Registers

Printable View (128 KB)

1. Remove the components in the order indicated in the following illustration and table. To remove individual components, only carry out the following steps:

Component	Steps
Driver side register	1
Passenger side register	2
Center register	3-6

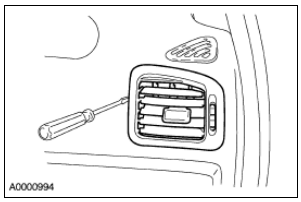
2. To install, reverse the removal procedure.



Item	Part Number	Description
1	19893A	Driver side register Removal Note
2	19893B	Passenger side register Removal Note
3	19893C	Center register Removal Note
4	14401	Message center switch electrical connector
5	W704874	Message center switch screw (2 req'd)
6	19D996	Message center switch assembly

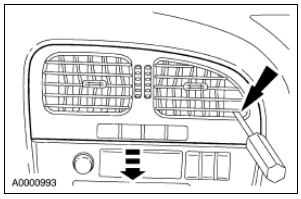
Item 1-2: Driver Side and Passenger Side Register Removal Note

1. Depress the inboard side tab with a flat blade tool. Pull the register rearward, depress the outboard tab and remove the register.



Item 3: Center Register Removal Note

1. Insert a mini-pick in the pocket and pull the register from the instrument panel.



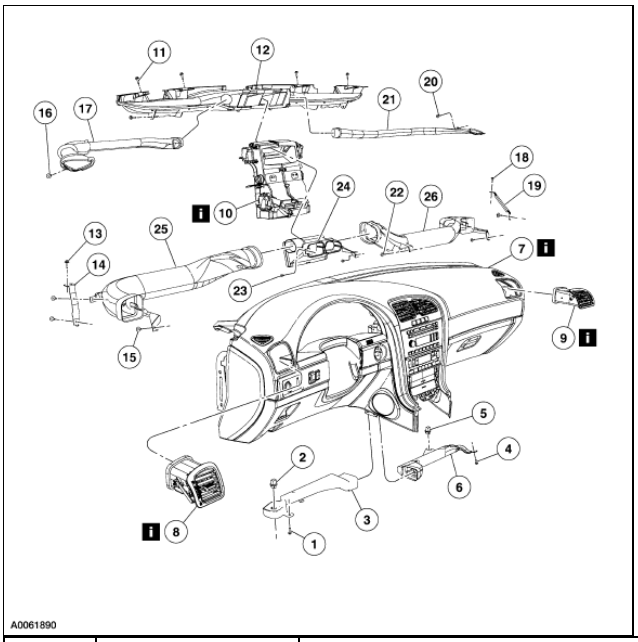
Air Distribution Ducts

Printable View (306 KB)

1. If removing the front floor ducts, remove the instrument panel lower insulators.
2. If removing the rear seat floor ducts, remove the front seats. For additional information, refer to Section 501-10 .
3. If removing the rear seat floor ducts, remove the lower cowl trim panels and front door sill plates to position the carpet away from the ducts.
4. If removing the fresh air inlet duct, remove the cowl panel grille. For additional information refer to Section 501-00 .
5. To remove individual components, only carry out the following steps:

Component	Steps
LH floor duct	1-3
RH floor duct	4-6
Defroster duct	7, 11-12
Demister ducts	7, 11-12, 16-17, 20-21
Panel ducts	7-26
Floor console ducts	27-33
Rear seat floor ducts	34-36
Fresh air inlet duct	38-44

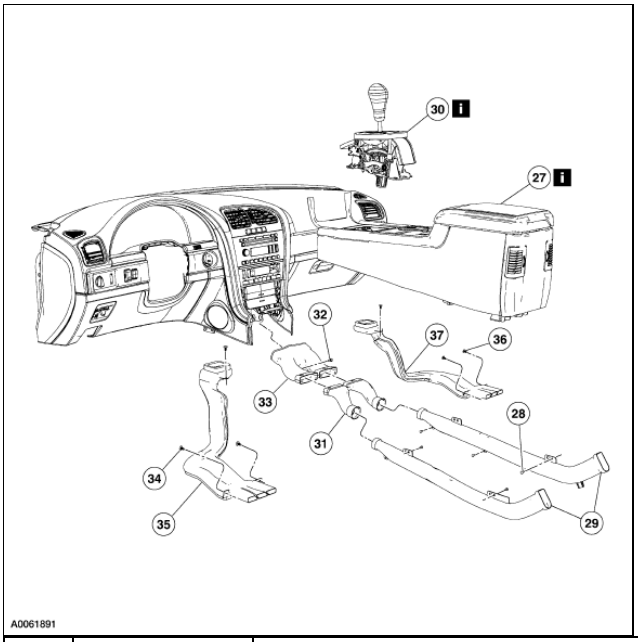
6. Illustration 1 of 3. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1	W704875	LH floor duct screw

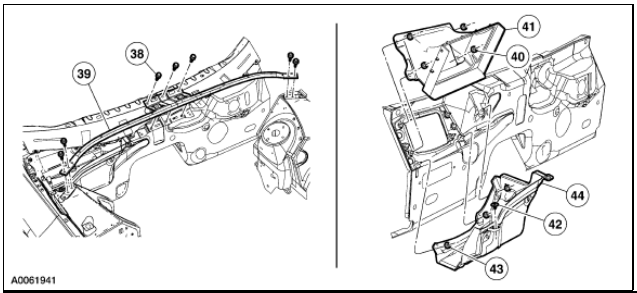
2	14401	Courtesy lamp socket
3	19B680A	LH floor duct
4	W704875	RH floor duct screw
5	14401	RH courtesy lamp socket
6	19B680C	RH floor duct
7	7804304	Instrument panel Removal Note
8	19893A	LH instrument panel register Removal Note
9	19893B	RH instrument panel register Removal Note
10	19C698	Plenum chamber Removal Note
11	W704874	Defroster duct screw (5 req'd)
12	18490	Defroster duct
13	W704874	LH instrument panel brace screw (3 req'd)
14	042K50	LH instrument panel brace
15	W704874	LH instrument panel duct screw
16	W704874	LH demister nozzle screw
17	19E630A	LH demister nozzle
18	W704874	RH instrument panel brace screw (2 req'd)
19	042K50	RH instrument panel brace
20	W704874	RH demister nozzle screw
21	19E630B	RH demister nozzle
22	W704874	RH panel duct screw (2 req'd)
23	W704874	Center panel duct screw (2 req'd)
24	19B680B	Center panel duct
25	19A843	LH panel duct
26	19B680D	RH panel duct

7. Illustration 2 of 3. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
27	78045806	Floor console Removal Note
28		Floor console duct pin-type retainer
29	18C420	Floor console duct (2 req'd)
30	7210	Transmission selector assembly Removal Note
31	18C420	Floor console duct adapter
32	W704874	Floor console duct adapter screw
33	18C420	Floor console duct adapter
34	W705589	LH rear seat floor duct pin-type retainer (3 req'd)
35	18C420	LH rear seat floor duct
36	W705589	RH rear seat floor duct pin-type retainer (3 req'd)
37	18C420	RH rear seat floor duct

8. Illustration 3 of 3. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
38	W705551	Support brace bolt (7 req'd)
39	3B336	Support brace
40		Fresh air inlet duct nut (4 req'd)
41	01934	Fresh air inlet duct
42		Insulator pin-type retainer

43		Insulator nut (3 req'd)
44	016A50	Insulator

9. To install, reverse the removal procedure.

Item 7: Instrument Panel Removal Note

1. Remove the instrument panel. For additional information, refer to Section 501-01 .

Item 8-9: LH and RH Instrument Panel Register Removal Note

1. Remove the instrument panel register. For additional information, refer to Instrument Panel Registers in this section.

Item 10: Plenum Chamber Removal Note

1. Remove the plenum chamber. For additional information, refer to Plenum Chamber, Assembly and Components in this section.

Item 27: Floor Console Removal Note

1. Remove the floor console. For additional information, refer to Section 501-01 .

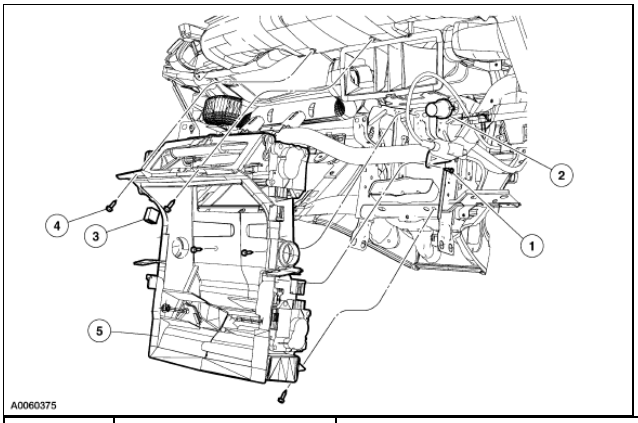
Item 30: Transmission Selector Assembly Removal Note

1. Remove the transmission selector assembly. For additional information, refer to Section 307-01

Plenum Chamber, Assembly and Components

Printable View (117 KB)

1. Remove the instrument panel. For additional information, refer to Section 501-01 .
2. Remove the components in the order indicated in the following illustration and table.
3. To install, reverse the removal procedure.



Item	Part Number	Description
1	W701696	Shift interlock actuator screw
2	19E628	Aspirator tube
3	14401	Actuator electrical connector (4 req'd)
4	W701696	Plenum chamber screw (5 req'd)
5	19C698	Plenum chamber

Heater Control Valve and Heater Hoses

Printable View (248 KB)

NOTE: Lubricate the coolant hoses with plain water only if needed.

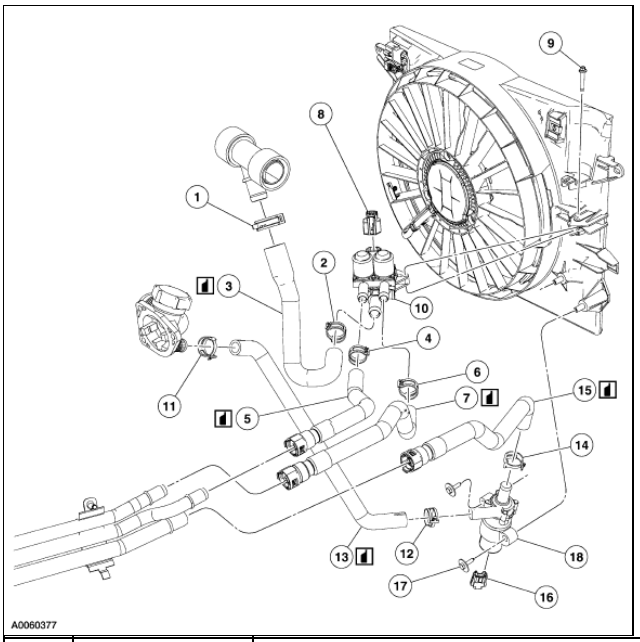
1. If removing a heater hose or the heater tube assembly, drain the engine cooling system. For additional information, refer to Section 303-03 .

2. If removing the dual coolant control valve or the auxiliary coolant flow pump, clamp off the heater hoses at the component before disconnecting.

3. To remove individual components, only carry out the following steps:

Component	Steps
Heater hoses	1-7, 11-15
Heater tube assembly	5, 7, 15, 19-24
Dual coolant control valve	2, 4, 6, 8-10
Auxiliary coolant flow pump	12, 14, 16-18

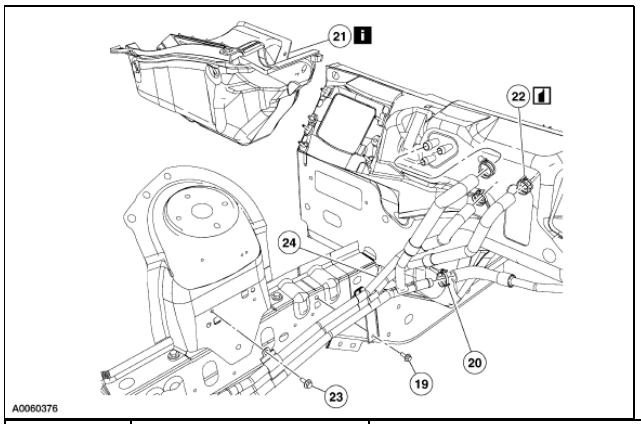
4. Illustration 1 of 2. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1	8287	Clamp
2	8287	Clamp
3	18472	Heater hose
4	8287	Clamp
5	18N345	Heater hose
6	8287	Clamp
7	18472	Heater hose

8	18C463	Dual coolant control valve electrical connector
9		Dual coolant control valve bolt
10	18495	Dual coolant control valve
11	8287	Clamp
12	8287	Clamp
13	18472	Heater hose
14	8287	Clamp
15	18472	Heater hose
16	18C463	Auxiliary coolant flow pump electrical connector
17		Auxiliary coolant flow pump bolt (2 req'd)
18	18D473	Auxiliary coolant flow pump

5. Illustration 2 of 2. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
19	W702434	Heater tube assembly bracket bolt
20	8287	Clamp
21	01934	Fresh air inlet duct Removal Note
22	8287	Clamp
23	W702434	Heater tube assembly bolt
24	18B402	Heater tube assembly

6. Fill the engine cooling system. For additional information, refer to Section 303-03 .

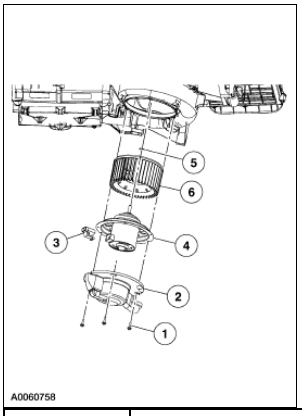
Item 21: Fresh Air Inlet Duct Removal Note

1. Remove the fresh air inlet duct. For additional information, refer to Air Distribution Ducts in this section.

Blower Motor

Printable View (37 KB)

1. Remove the RH floor duct. For additional information, refer to Air Distribution Ducts in this section.
2. Remove the components in the order indicated in the following illustration and table.
3. To install, reverse the removal procedure.



Item	Part Number	Description
1	W705314	Blower motor screw (3 req'd)
2	18515	Blower motor cover
3	19D887	Blower motor electrical connector
4	19805	Blower motor
5	18A287	Blower motor wheel clip
6	18504	Blower motor wheel

Heater Core and Evaporator Core Housing, Assembly and Components

Printable View (306 KB)

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) F7AZ-19589-DA (Motorcraft YN-12-C)	WSH-M1C231-B

NOTE: Installation of a new receiver drier is not required when repairing the air conditioning system except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver drier.

NOTE: New O-ring seals, lubricated in clean PAG oil, must be installed before reconnecting any A/C fitting that has been disconnected.

NOTE: If an evaporator core leak is suspected, the evaporator core must be vacuum leak tested.

NOTE: If a heater core leak is suspected, the heater core must be leak tested before it is removed from the vehicle.

NOTE: Lubricate the coolant hoses with plain water only if needed.

1. Recover the refrigerant. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

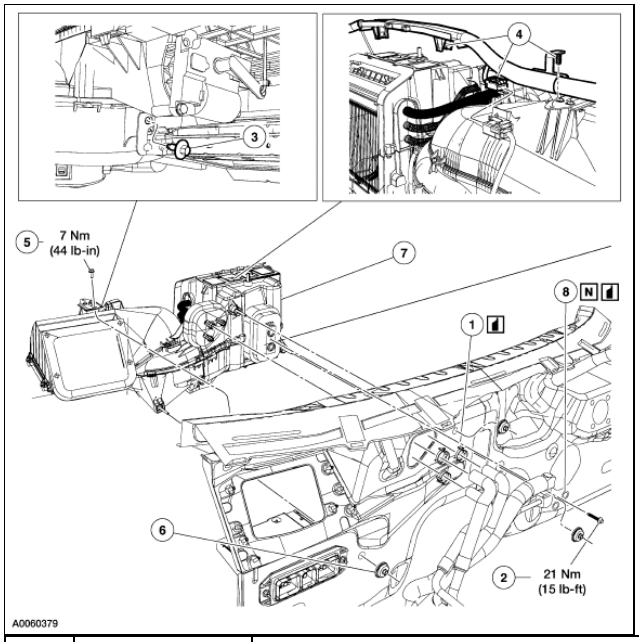
2. Partially drain the cooling system. For additional information, refer to Section 303-03 .

3. Remove the instrument panel. For additional information, refer to Section 501-01 .

4. To remove individual components, only carry out the following steps:

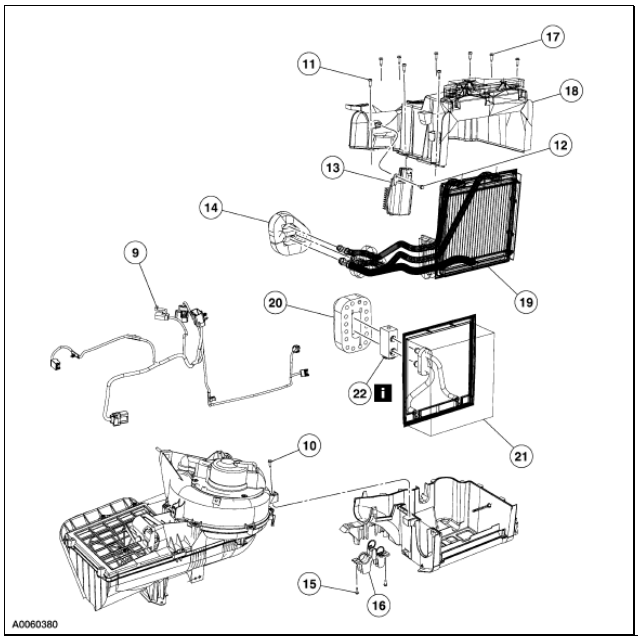
Component	Steps
Heater core and evaporator core housing	1-8
Blower motor speed control	1-13
Heater core	1-19
Evaporator core	1-18, 20-22

5. Illustration 1 of 2. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1	8287	Heater hose clamp
2	N805334S2	Thermostatic expansion valve manifold bolt
3	N606675	PCM bracket bolt
4	19D887	Wire harness
5	N706467	Heater core and evaporator core housing bracket bolt
6	W706467	Heater core and evaporator core housing nut (3 req'd)
7	19850	Heater core and evaporator core housing
8	19E889	Thermostatic expansion valve O-ring (2 req'd)

6. Illustration 2 of 2. Remove the components in the order indicated in the following illustration and table.



Item		Description

	Part Number	
9	19D887	Wire harness
10	W705314	Heater core and evaporator core housing screw
11	W705314	Heater core and evaporator core housing screw
12	W705314	Blower motor speed control screw
13	19E624	Blower motor speed control
14	18529	Heater core tube seal
15	W705314	Heater core tube bracket screw (2 req'd)
16	18A456	Heater core tube bracket
17	W705314	Heater core and evaporator core housing screw (8 req'd)
18	19897	Heater core and evaporator core housing cover
19	19B539	Heater core
20	19A672	Thermostatic expansion valve seal
21	19860	Evaporator core
22	19849	Thermostatic expansion valve Removal Note

7. To install, reverse the removal procedure.

8. Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Refrigerant Oil Adding in this section.

9. Fill the engine coolant level. For additional information, refer to Section 303-03 .

10. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

Item 22: Thermostatic Expansion Valve Removal Note

1. Remove the thermostatic expansion valve. For additional information, refer to Thermostatic Expansion Valve in this section.

Air Conditioning (A/C) Compressor 3.0L (4V)

Printable View (188 KB)

Special Tool(s)

 ST1260-A	2-Jaw Puller 205-D026 (D80L-1002-L) or equivalent
 ST1235-A	Holding Fixture, Compressor Clutch 412-098 (T94P-19703-AH)

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) F7AZ-19589-DA (Motorcraft YN-12-C)	WSH-M1C231-B
Silicone Gasket and Sealant F7AZ-19554-EA	WSE-M4G323-A4

⚠ CAUTION: If installing a new air conditioning compressor due to an internal failure of the old unit, you must carry out the following procedures to remove contamination from the air conditioning system.

- If A/C flushing equipment is available, carry out flushing of the air conditioning system prior to installing a new air conditioning compressor. For additional information, refer to Air Conditioning (A/C) System Flushing in this section.
- If A/C flushing equipment is not available, carry out filtering of the air conditioning system after a new air conditioning compressor has been installed. For additional information, refer to Refrigerant System Filtering After A/C Component Replacement in this section.
- Install a new thermostatic expansion valve, as directed by the A/C flushing or filtering procedure.
- Install a new receiver drier (19950) as directed by the A/C flushing or filtering procedure.

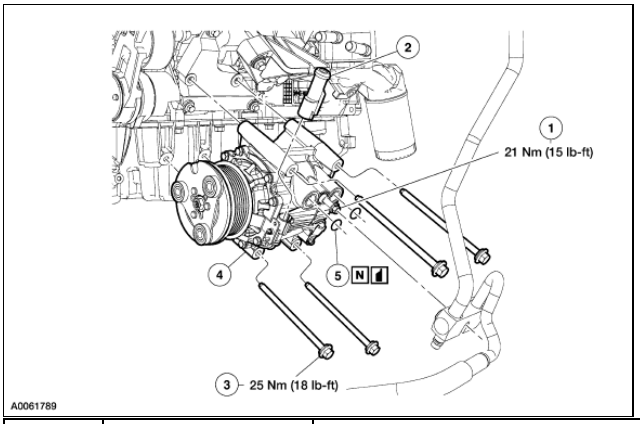
NOTE: Installation of a new receiver drier is not required when repairing the air conditioning system except when there is physical evidence of system contamination from a failed A/C compressor or damage to the receiver drier.

NOTE: New O-ring seals, lubricated in clean PAG oil, must be installed before reconnecting any A/C fitting that has been disconnected.

1. Recover the refrigerant. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

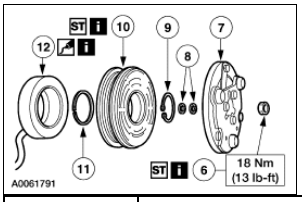
2. Remove the drive belt from the A/C compressor pulley.

3. Illustration 1 of 2. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1	W704692	A/C compressor manifold bolt
2	12B637	A/C clutch field coil electrical connector
3	W704692	Compressor bolt (4 req'd)
4	19703	A/C compressor
5	19E889	O-ring (2 req'd)

4. Illustration 2 of 2. Remove the component in the order indicated in the following illustration and table.



Item	Part Number	Description
6	W704577-S301	A/C clutch nut Removal Note
7	19D786	A/C clutch hub
8	19D648	A/C clutch hub spacer
9	W701742-S301	A/C clutch pulley snap ring
10	19D784	A/C clutch pulley Removal Note
11	W704579-S301	A/C clutch field coil snap ring
12	19D798	A/C clutch field coil Removal Note

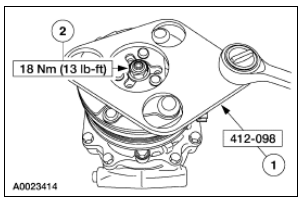
5. To install, reverse the removal procedure.

6. If filtering of the refrigerant system is not to be carried out, lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Refrigerant Oil Adding in this section.

7. If filtering of the refrigerant system is not to be carried out, evacuate, leak test and charge the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

Item 6: A/C Clutch Nut Removal Note

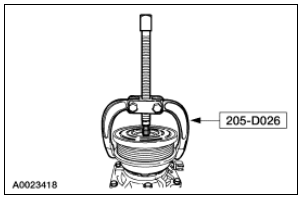
1. Remove the A/C clutch nut.
    1. Using the special tool, hold the clutch plate.
    2. Remove the nut.



Item 10: A/C Clutch Pulley Removal Note

1. ⚠ **CAUTION: Do not use air tools. Damage to the A/C clutch pulley or A/C compressor may result.**

   Using the special tool, remove the A/C clutch pulley.



Item 12: A/C Clutch Field Coil Removal Note

1. **NOTE:** Apply a pea-sized drop of silicone sealant to the thermal limiter socket before installing the thermal limiter into the A/C compressor. Failure to use the approved sealant listed in the materials table may affect the function of the switch.

   Remove the thermal limiter.

    1. Remove the bolt and the hold-down bracket.
    2. Remove the thermal limiter.

- Install a new receiver drier (19C836) as directed by the A/C flushing or filtering procedure.

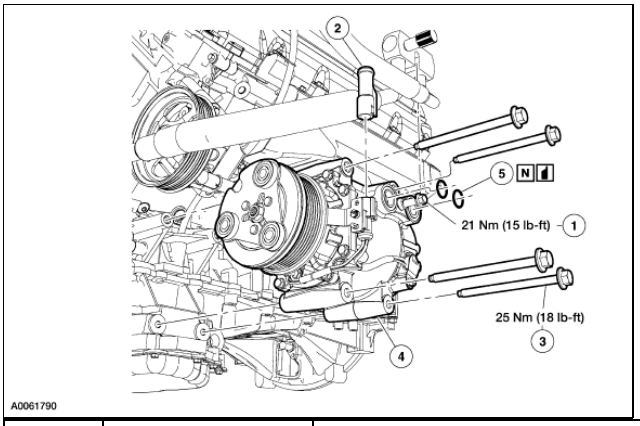
NOTE: Installation of a new receiver drier is not required when repairing the air conditioning system except when there is physical evidence of system contamination from a failed A/C compressor or damage to the receiver drier.

NOTE: New O-ring seals, lubricated in clean PAG oil, must be installed before reconnecting any A/C fitting that has been disconnected.

1. Recover the refrigerant. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

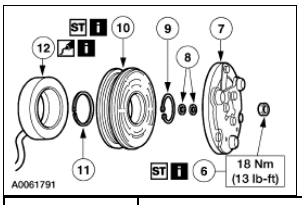
2. Remove the drive belt from the A/C compressor pulley.

3. Illustration 1 of 2. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1	W704692	A/C compressor manifold bolt
2	12B637	A/C clutch field coil electrical connector
3	W704692	Compressor bolt (4 req'd)
4	19703	A/C compressor
5	19E889	O-ring (2 req'd)

4. Illustration 2 of 2. Remove the component in the order indicated in the following illustration and table.



Item	Part Number	Description
6	W704577-S301	A/C clutch nut Removal Note
7	19D786	A/C clutch hub
8	19D648	A/C clutch hub spacer
9	W701742-S301	A/C clutch pulley snap ring
10	19D784	A/C clutch pulley Removal Note
11	W704579-S301	A/C clutch field coil snap ring
12	19D798	A/C clutch field coil Removal Note

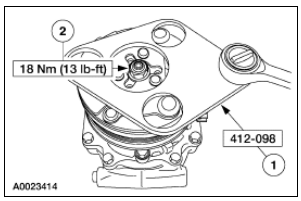
5. To install, reverse the removal procedure.

6. If filtering of the refrigerant system is not to be carried out, lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Refrigerant Oil Adding in this section.

7. If filtering of the refrigerant system is not to be carried out, evacuate, leak test and charge the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

Item 6: A/C Clutch Nut Removal Note

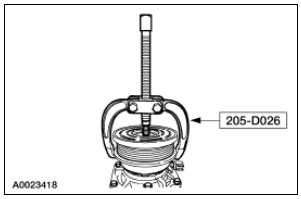
1. Remove the A/C clutch nut.
    1. Using the special tool, hold the clutch plate.
    2. Remove the nut.



Item 10: A/C Clutch Pulley Removal Note

1. ⚠ **CAUTION: Do not use air tools. Damage to the A/C clutch pulley or A/C compressor may result.**

   Using the special tool, remove the A/C clutch pulley.

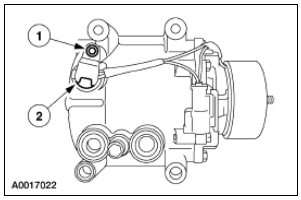


Item 12: A/C Clutch Field Coil Removal Note

1. **NOTE:** Apply a pea-sized drop of silicone sealant to the thermal limiter socket before installing the thermal limiter into the A/C compressor. Failure to use the approved sealant listed in the materials table may affect the function of the switch.

   Remove the thermal limiter.

    1. Remove the bolt and the hold-down bracket.
    2. Remove the thermal limiter.



Receiver Drier

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) F7AZ-19589-DA (Motorcraft YN-12-C)	WSH-M1C231-B

NOTE: Installation of a new receiver drier is not required when repairing the air conditioning system except when there is physical evidence of contamination from a failed A/C compressor or damage to the receiver drier.

NOTE: New O-ring seals, lubricated in clean PAG oil, must be installed before reconnecting any A/C fitting that has been disconnected.

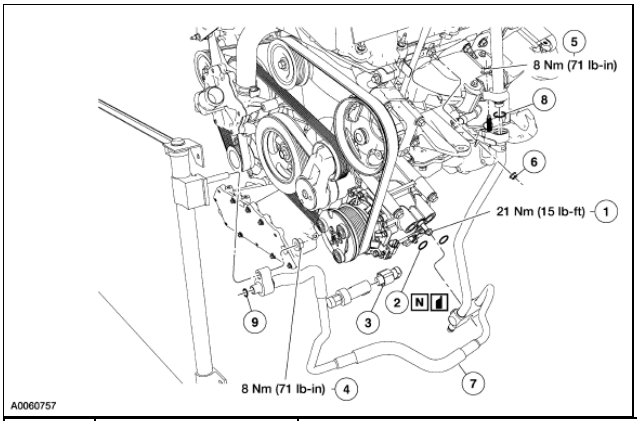
1. Position the vehicle on a hoist with the gear selector in NEUTRAL. For additional information refer to Section 100-00 .
2. Recover the refrigerant. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.
3. Remove the engine air cleaner. For additional information, refer to Section 303-04A .
4. Remove the components in the order indicated in the following illustration and table.
5. To install, reverse the removal procedure.



Item	Part Number	Description
1	W704692	A/C compressor manifold bolt
2	19E889	O-ring (2 req'd)
3	14290	A/C pressure switch electrical connector
4	W520413	A/C fitting nut
5	W520413	A/C fitting nut
6		Compressor manifold and tube bracket nut

7	19D734	Compressor manifold and tube assembly
8	19E889	O-ring
9	19E889	O-ring

6. Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Refrigerant Oil Adding in this section.

7. Evacuate, leak test and charge the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

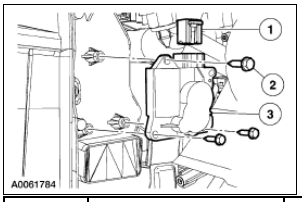
Printable View (30 KB)

1. Remove the LH floor duct. For additional information, refer to Air Distribution Ducts in this section.
2. Remove the components in the order indicated in the following illustration and table.
3. To install, reverse the removal procedure.

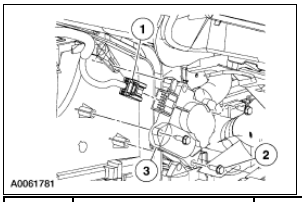


Item	Part Number	Description
1	14401	Floor duct door actuator electrical connector
2	W701696-S	Floor duct door actuator screw (3 req'd)
3	19E616	Floor duct door actuator

Mode Door Actuator Cold Air Bypass Door

Printable View (37 KB)

1. Remove the LH floor duct. For additional information, refer to Air Distribution Ducts in this section.
2. Remove the components in the order indicated in the following illustration and table.
3. To install, reverse the removal procedure.



Item	Part Number	Description
1	19D887	Cold air bypass door actuator electrical connector
2	W701696-S	Cold air bypass actuator screws (3 req'd)
3	19E616	Cold air bypass door actuator

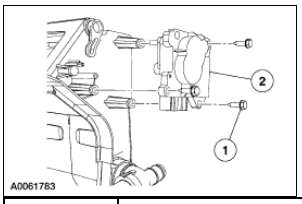
Mode Door Actuator Defrost Door

Printable View (26 KB)

1. Remove the plenum chamber. For additional information, refer to Plenum Chamber, Assembly and Components in this section.

2. Remove the components in the order indicated in the following illustration and table.

3. To install, reverse the removal procedure.



Item	Part Number	Description
1	W701696-S	Defrost door actuator screw (2 req'd)
2	19E616	Defrost door actuator

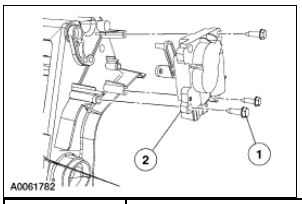
Mode Door Actuator Panel Door

Printable View (28 KB)

1. Remove the plenum chamber. For additional information, refer to Plenum Chamber, Assembly and Components in this section.

2. Remove the components in the order indicated in the following illustration and table.

3. To install, reverse the removal procedure.



Item	Part Number	Description
1	W701696-S	Panel door actuator screw (3 req'd)
2	19E616	Panel door actuator

Instrument Cluster and Panel Illumination Printable View (9 KB)

The instrument cluster and panel illumination is used to provide backlighting to the instrument panel, switches and control components when the headlamp switch is in either the parking lamp ON or headlamp ON position. The level of intensity is adjustable by rotating the instrument panel dimmer switch either up to increase intensity or down to decrease intensity.

Principles of Operation

Instrument Cluster and Panel Lighting Dimmable

The instrument panel dimmer switch allows the brightness level of the backlights and displays to be adjusted dependent upon the headlamp switch position and the instrument panel dimmer switch position. The instrument panel dimmer switch sends a signal to the instrument cluster which then sends a backlighting intensity and dimming curve command over the standard corporate protocol (SCP) communication network to the front electronic module (FEM). The FEM then sends a pulse width modulated (PWM) dimming signal to the instrument cluster, the dimmable LEDs, and the dimmable incandescents.

When the headlamp switch is in the parking lamp ON, headlamp ON, or the autolamp ON position and the autolamp feature is active, synchronized dimming of the dimmable components can be controlled with the instrument panel dimmer switch.

All backlighting will be disabled when the battery saver function has been activated.

Fault Management

The dimmable backlighting will default to 100% intensity if an instrument panel dimmer switch failure occurs.

Instrument Cluster

Printable View (18 KB)

The base and optional instrument clusters both contains gauges, indicator lamps, and warning lamps that are designed to provide the driver with system status and to alert the driver that certain conditions exist in the vehicle. The optional instrument cluster contains the message center and is located in the lower RH corner of the cluster. Gauges provide information to the driver indicating the status of systems. The systems that use gauges include vehicle speed, fuel level, engine coolant temperature, and engine rpm. Indicator lamps provide information to the driver of conditions that exist in the vehicle. The indicator lamps include the turn signal, low washer fluid level, traction control, and speed control. Warning indicator lamps provide information to the driver of conditions that could potentially alter vehicle performance. Examples of the warning indicators include the ABS, BRAKE, safety belt, and low oil pressure.

Principles of Operation

NOTE: The instrument cluster, front electronic module (FEM), and the rear electronic module (REM) must be reconfigured upon replacement. Refer to Section 418-00 .

NOTE: The diagnostic tool may display ICM for the instrument cluster.

NOTE: For any concerns with the restraint control module (RCM), refer to Section 501-20B .

The instrument cluster is a hybrid electronic instrument cluster (HEC). The vehicle electronic functions are divided into zones. The instrument cluster, FEM, and REM use the standard corporate protocol (SCP) communication network to transmit and receive information. It is very important to understand:

- where the input (command) originates from
- all information (messages) necessary in order for a feature to operate
- which module(s) receive(s) the input or command message
- does the module which received the input (message), control the output of the feature, or does it output a message over the SCP communication network to another module
- which module controls the output of the feature

The instrument cluster communicates with the FEM, REM, anti-lock brake system/traction control/interactive vehicle dynamics (ABS/TC/IVD), powertrain control module (PCM), steering column lock (SCL), message center (MC) module, and the RCM over the SCP to control the gauges, indicators, and chimes.

Integrated Circuit Display

The integrated circuit display maintains three separate functions housed in a single display area, the warning center display, the trip A/B, and the odometer display.

Warning Center Display

The warning center display is a florescent vacuum tube display that alerts the driver of a lamp outage condition. The FEM and REM both control the exterior illumination. When an exterior lamp(s) is inoperative, the FEM or REM notify the instrument cluster over the SCP communication network and the instrument cluster illuminates the warning center message LAMP OUT. The warning center message will remain on until the condition is corrected. Once the condition is corrected, the warning center will display the trip odometer.

Trip A/B And Odometer Displays

The vehicle speed signal (VSS) from all four wheels is hardwired directly to the ABS/TC. The speed status is then sent to the instrument cluster by the ABS/TC over the SCP communication network to establish a rolling count.

PRNDL Display

The digital transmission range (TR) sensor is hardwired directly to the PCM. The status of the gear selection is sent to the instrument cluster from the PCM over the SCP communication network.

Gauges

Fuel Gauge

The fuel gauge system has a saddle-type fuel tank with two integrated fuel senders: the fuel delivery module and the jet pump module. The fuel delivery module is located in the right side of the fuel tank and the jet pump module is located in the left side of the fuel tank. Fuel level status is sent directly to the REM, which is hardwired to the fuel senders. The REM sends the fuel data to the instrument cluster via the SCP line. Normal operating range of the fuel delivery module is from 16 ± 2 ohms at empty (E) to 155 ± 4 ohms at full (F). Normal operating range of the jet pump module sender is from 19 ± 2 ohms at empty (E) to 160 ± 2 ohms at full (F). If either the REM or jet pump module fuel sender has an open or shorted signal, the instrument cluster will log diagnostic trouble code (DTC) B1201. If the jet pump module sender is open, the fuel gauge will default to the fuel delivery module sender value only and the fuel gauge will indicate E to 1/2 tank (depending on the fuel level on the fuel delivery module side of the tank). If the fuel delivery module is open, the fuel gauge will default to the empty position.

Speedometer Gauge

The instrument cluster uses a vehicle speed signal from the ABS/TC/IVD system to control the movement of the speedometer pointer. Vehicle speed information is sent to the ABS/TC/IVD module from all four wheel speed sensors, which is then sent to the instrument cluster by the ABS/TC/IVD module over the SCP communication network.

Tachometer Gauge

The instrument cluster uses crankshaft speed information, sent to the PCM from the crankshaft position sensor, to control the movement of the tachometer pointer. The crankshaft position sensor is hardwired directly to the PCM, which provides the crankshaft position sensor status to the instrument cluster over the SCP communication network.

Temperature Gauge

The cylinder head temperature sensor is hardwired directly to the PCM. The status of the cylinder head temperature is sent from the PCM over the SCP communication network to the instrument cluster. Normal operating temperature is 60° C (140° F) to 120° C (248° F). Redline starts at 121° C (249.8° F).

Warning Indicator Lamps

Air Bag Warning Indication

The supplemental restraint system is monitored and controlled by the RCM. The status of the supplemental system is sent from the RCM to the instrument cluster through hardwired circuitry. The AIR BAG warning indicator is illuminated if the restraint control module (RCM) sends a ground signal to the instrument cluster.

ABS Warning Indication

The ABS is monitored by the ABS, ABS/TC or ABS/TC/IVD module, which sends the status signal to the instrument cluster over the SCP communication network. The instrument cluster uses this input to determine whether or not there is a fault with the ABS, ABS/TC or ABS/TC/IVD system and turns on the ABS warning indicator according to the input.

Brake Warning Indication

The brake warning indicator supports three separate functions: base brake system failure, low brake fluid level, and engagement of the parking brake. These functions are controlled by the parking brake control switch, the brake fluid level switch and the brake system itself. The brake fluid level switch and the parking brake control switch are hardwired directly to the FEM. The status of both the brake fluid level and parking brake switches are sent from the FEM to the instrument cluster over the SCP communication network. The base brake system status is monitored by the ABS/TC module and sent to the instrument cluster over the SCP communication network.

Charging System Warning Indicator

The charging system controls are accomplished through the PCM, which monitors the output of the generator through hardwired circuitry. The status of the charging system is then relayed from the PCM to the instrument cluster over the SCP communication network.

Door Ajar Warning Indication (Base Cluster Only)

The door switches for the rear of the vehicle are directly hardwired to the REM. The door switches for the front of the vehicle are directly hardwired to the FEM. The FEM and REM both use the multiple inputs from the door switches to determine whether the doors are in the opened or closed position. The door ajar status is sent to the instrument cluster from both the FEM and REM over the SCP communication network.

Engine Over-Temperature Warning Indicator

The engine over-temperature status is determined by the cylinder head temperature sensor, which is hardwired directly to the PCM. The status of the cylinder head temperature is sent from the PCM over the SCP communication network to the instrument cluster. The instrument cluster then determines whether or not the cylinder head temperature is above the over-temperature threshold.

Low Fuel Warning Indicator (Base Cluster Only)

There are two fuel tank senders, which are hardwired directly to the REM. The status of the fuel level from both senders is sent from the REM over the SCP communication network to the instrument cluster. The instrument cluster uses these inputs to determine the overall fuel level in the tank and illuminates the low fuel warning indicator if the fuel level is low.

Low Washer Fluid Warning Indication (Base Cluster Only)

The low washer fluid level switch is hardwired directly to the FEM. The FEM monitors the washer fluid level status and sends it to the instrument cluster via the SCP communication network.

Safety Belt Warning Indicator

The instrument cluster receives the safety belt warning status from the RCM through hardwired circuitry. The safety belt switch is hardwired to the RCM. When the safety belt is fastened, the safety belt switch opens and removes the ground to the RCM and when the safety belt is unfastened, the safety belt switch closes and grounds the circuit to the RCM.

Indicator Lamps

Advance Traction Indication

The status of the advance traction control system is communicated to the instrument cluster from the ABS/TC/IVD module over the SCP communication network. When the advance traction control system is switched OFF, the ABS/TC/IVD module will send a command to the instrument cluster to illuminate the advance traction indicator.

CHECK FUEL CAP (Base Cluster Only)

The CHECK FUEL CAP indicator is used to indicate significant leaks in the fuel tank evaporative system due to a loose fuel cap. Fuel tank pressure is monitored by the PCM and if a leak is detected it signals a fault to the instrument cluster over the SCP network. Once the PCM has detected a loose fuel cap and the CHECK FUEL CAP indicator is illuminated, the indicator will remain illuminated until the fuel cap is secured and the ignition switch has been cycled one time.

Electronic Throttle Control (Base Cluster Only)

The instrument cluster receives the electronic throttle control status from the PCM over the SCP communication network. When a system concern is detected, the PCM sends the instrument cluster a command signal to turn the electronic throttle control indicator ON.

High Beam Indication

The multifunction switch is hardwired directly to the instrument cluster. The headlamp status is then sent from the instrument cluster to the FEM via the SCP communication network.

Low Oil Pressure Indication

The low oil pressure switch is hardwired to the FEM. The status of the oil pressure is sent from the FEM to the instrument cluster via the SCP communication network.

Malfunction Indicator Lamp (MIL)

After the engine is started, the MIL proves out for a duration of three seconds. If the instrument cluster does not receive a message from the PCM within five seconds, it sends two messages to the PCM and attempt to reestablish communication. If the instrument cluster is unable to reestablish communication, the instrument cluster illuminates the MIL and logs a diagnostic trouble code (DTC).

Speed Control Indication

The speed control status is monitored by the PCM and then relayed to the instrument cluster via the SCP communication network. The speed control indicator illuminates when the speed control is set.

Steering Column Lock Indication

The instrument cluster monitors the key-in-ignition status, ignition switch position status and the steering column lock status. When the key is in the ignition, the key is in the RUN position and the steering column is locked, the instrument cluster turns on the steering column lock warning indicator. The steering column lock status is sent to the instrument cluster from the steering column lock (SCL) module over the SCP communication network.

Traction Control Indication

The status of the traction control is communicated to the instrument cluster from the ABS/TC/IVD module via the SCP communication network. When the traction control system is active, the ABS/TC/IVD module sends a command to the instrument cluster to illuminate the traction control indicator.

Turn/Hazard Indication

The multifunction switch is hardwired directly to the instrument cluster. The instrument cluster sends the signal from the multifunction switch to both the FEM and REM via the SCP communication network while simultaneously illuminating the turn/hazard indicators. The FEM and the REM use these inputs from the instrument cluster to illuminate the exterior lighting as necessary.

Horn

Printable View (8 KB)

There are two separate conditions that can cause the horn to sound. The horn sounds if the driver presses the horn switch(es) and when the remote keyless entry is armed. The horn system uses a horn relay to provide voltage to the horns while the horn switches and the front electronic module (FEM) provide the control grounds to engage the horn relay. The horn switch is located behind the drivers side air bag. For the removal and installation of the horn switch(es), refer to Horn Switch in this section. The FEM is located behind the LH A-pillar lower trim panel. For removal and installation of the FEM, refer to Section 418-00 .

Principles of Operation

When the horn switch is pressed, a message is sent from the instrument cluster over the network communication link to the FEM. The FEM acknowledges the message and energizes the horn relay by grounding the horn relay coil which allows the dual-note horn to sound.

Information And Message Center Printable View (13 KB)

The message center display is a green vacuum fluorescent, fixed format display. The message center display is integral to the instrument cluster. The message center is controlled by the four message center switches (FUEL, RESET, STATUS, and SETUP).

Principles of Operation

The message center is an integral part of the instrument cluster. The message center communicates with the powertrain control module (PCM), front electronic module (FEM), rear electronic module (REM), and anti-lock brake system (ABS)/traction control (TC)/stability assist module over the SCP network. As a technician, it is important to understand:

- where the input (command) originates from.
- all information (messages) necessary in order for a feature to operate.
- which module(s) receive(s) the input or command message.
- does the module which received the input (message) control the output of the feature, or does it output a message over the SCP communication network to another module?
- which module controls the output of the feature.

Display Information

The display modes are:

- fuel (average fuel economy, distance to empty)
- setup
- system status
- warning
- temporary alert

The message center information can be selected by pressing any of the following four buttons:

- FUEL
- RESET
- SETUP
- STATUS

The setup display and the status display will time-out and default to the fuel blank display function. The temporary alert display will interrupt the current display to show the status of an event that has just happened. The warning display interrupts the current display until cleared or reset by the driver.

Status Displays

The status displays are timed modes and default back to the fuel blank display function. The status display modes are:

- oil life %
- AC air filter life %
- charging system
- low oil

- engine temperature
- brake fluid level
- washer fluid level
- driver door
- passenger door
- driver rear door
- passenger rear door
- luggage compartment lid
- front turn lamps
- rear turn lamps
- stoplamps
- tail lamps
- traction control
- advance trac

Setup Displays

The setup displays are timed modes and default back to the fuel blank display function. The setup display modes are:

- language
- English/metric units
- autolocks on, autolocks off
- lock chirp on, lock chirp off
- easy entry on, easy entry off

Warning Messages

The warning messages can interrupt the display until cleared or reset by the driver. The warning messages are single cycle, non-resettable and repetitive warning messages. The single cycle warning messages are:

- change oil now (0%)
- change oil soon (1%-5%)
- low oil level
- low washer fluid level
- low brake fluid level
- check headlamps
- check brake lamps
- check tail lamps
- check front turn lamps
- check rear turn lamps
- change A/C air filter soon
- luggage compartment lid
- check fuel cap
- service park brake
- apply park brake

The single cycle warning messages will display once whenever the key is turned to ON or a fault occurs in a system and can be cleared by pressing the RESET button.

The repetitive warning messages are:

- check charging system
- low fuel level

- check transmission
- transmission overheated

The repetitive warning messages are displayed at a fixed interval whenever the key switch is turned ON or is in the ACC position. To remove a repetitive warning message, press the RESET button. The message will only recur after 10 minutes or until the warning condition is corrected.

The non-resettable warning messages displays whenever the key switch is turned to ON and a fault occurs in a system. The fault must be corrected to clear the non-resettable warning messages.

The non-resettable warning messages are:

- stop engine safely
- driver door ajar
- passenger door ajar
- driver rear door ajar
- passenger rear door ajar
- park brake on
- ETC-engine failsafe mode

Temporary Alert Messages

The temporary alert display will interrupt the current display to show the status of an event that has just happened. The temporary alert messages are:

- autolamp delay
- memory recall/save
- traction control
- advance trac
- speed control ON/OFF status

Warning Devices

Printable View (14 KB)

The instrument cluster controls the warning chime function. The warning chime sounds to alert the driver as a reminder to turn the headlamps off when exiting the vehicle, remove the ignition key when exiting the vehicle, close the doors after starting the vehicle, or to fasten the safety belt after starting the vehicle. The instrument cluster utilizes various inputs to determine when to sound the warning chime. The warning chime will sound if the headlamps have been left on with the key OFF and the driver door is ajar, the key is in the ignition with the key OFF and the driver door is ajar, a door is ajar while the key is in the RUN position, or the safety belts have not been fastened and the key is in the RUN position.

The instrument cluster will momentarily sound the chime to alert the driver when a warning message is first displayed on vehicles equipped with a message center. The instrument cluster will also momentarily sound the warning chime to alert the driver when the electronic park brake is applied, and again when the electronic park brake is released, for confirmation of park brake status.

Principles of Operation

The instrument cluster controls the following chimes:

- driver or passenger safety belt not fastened warning chime (warning times out)
- key-in-ignition warning (repetitive chime)
- headlamp-on warning (repetitive chime)
- door ajar warning (repetitive chime)
- safety belt warning chime (repetitive chime)
- belt minder warning chime (repetitive chime after a delay and the safety belt chime has completed)

The safety belt warning chime warns that the safety belt is not fastened. The safety belt warning chime sounds when the driver or passenger safety belt is not fastened and the key switch is turned from the OFF/LOCK or ACC to the RUN or START position.

The safety belt warning chime stops sounding when the safety belt is fastened, when the key switch is switched from the RUN or START to the OFF/LOCK or ACC position, or when the chime has sounded for approximately six seconds.

The safety belt warning chime inputs are:

- key in START position
- key in RUN position
- driver or passenger safety belt switch data communicated by the restraint control module (RCM) to the instrument cluster on circuit 8-GE52 (WH/BK)

The safety belt warning lamp along with the chime warns that the safety belt is not fastened. The safety belt warning lamp illuminates when the safety belt is not fastened and the key is turned from the OFF/LOCK or ACC to the RUN or START position.

The safety belt warning lamp turns off when the safety belt is fastened, the key is moved from the RUN or START to the OFF/LOCK or ACC position, or if the lamp is illuminated for approximately 6 seconds.

The safety belt warning lamp inputs are:

- key in START position
- key in RUN position
- driver or passenger safety belt switch data communicated by the restraint control module (RCM) to the instrument cluster on circuit 8-GE52 (WH/BK)

NOTE: The belt minder is configurable. For additional information, refer to Section 418-00 . To configure without using a diagnostic tool, refer to Belt Minder Deactivating/Activating in this section.

The belt minder feature supplements the current safety belt warning function. The belt minder is enabled after the current safety belt warning is complete. The belt minder reminds the driver that the driver or passenger safety belt is unbuckled by intermittently sounding a chime and illuminating the safety belt warning lamp in the instrument cluster. While activated, the belt minder alternates the chime and indicator from on for 6 seconds to off for 30 seconds.

The door ajar warning chime warns that a door is not fully closed. The chime sounds when any door or the luggage compartment lid becomes ajar while the key is in the RUN position.

The door ajar warning indicator warns that a door is not fully closed. The door ajar warning indicator illuminates when any door or the luggage compartment lid initially becomes ajar while the key is in the RUN position.

The door ajar warning indicator turns off when all doors and the luggage compartment lid are closed, or the key is turned to the OFF/LOCK or ACC position.

The door ajar warning lamp/chime inputs are:

- key in START position
- key in RUN position
- door ajar data communicated by the FEM and REM to the instrument cluster on the SCP communication network

The key-in-ignition warning chime warns that the key is still in the ignition when the driver door is ajar. The key-in-ignition warning chime sounds when the driver door is ajar and the key is in the ignition switch.

The key-in-ignition warning chime stops sounding when the driver door is closed or the key is removed from the ignition.

The key-in-ignition warning chime input is the key-in-ignition switch circuit 30S-GM7 (RD/WH), voltage applied with the key in ignition.

The headlamp on warning chime warns that the headlamps are on when the driver door is ajar and the key is removed from the ignition. The headlamps on warning chime sounds if the driver door is ajar, the headlamp switch is in the PARK or HEAD position, and the key is in the OFF/LOCK position with the key out.

The headlamp on warning chime will stop sounding when any one of the above conditions are removed.

The headlamp on warning chime inputs are:

- key in START position
- key in RUN position
- key-in-ignition switch circuit 30S-GM7 (RD/WH), no voltage applied with the key removed from the ignition switch

Parking Aid Printable View (8 KB)

The parking aid system sounds a warning to alert the driver of stationary objects near the rear bumper when the REVERSE gear is selected. The parking aid system assists the driver in detecting certain objects while the vehicle moves slowly in REVERSE at speeds less than 3 mph (4.8 km/h). The parking aid system may not detect angular or moving objects.

Principles of Operation

The parking aid system detects objects behind the vehicle when the vehicle is in REVERSE. The parking aid does this by calculating the distance to an object by the use of two ultrasonic sensors and one radar sensor mounted in the rear bumper. The field is emitted in a semicircular area around the rear of the vehicle. The sensors can detect objects up to 5 m (16.4 ft) to the rear of the vehicle, 50 cm. (1.6 ft) to the rear side of the vehicle, and 16 cm. (6 in) above ground. A 750 Hz variable warning tone is generated by the parking aid module speaker integrated in the parking aid module. The speaker increases its warning tone rate as the vehicle gets closer to an obstacle. When an object is detected within 45 cm. (18 inches) of the sensors, the warning tone becomes continuous.

The parking aid system is enabled when the vehicle ignition is in RUN and REVERSE gear is selected. The system will always enable when the ignition is transitioned to RUN and REVERSE gear is selected.

The parking aid system is disabled if any fault is detected. The parking aid switch indicator will illuminate for two seconds when the key is transitioned to RUN if no fault is detected. If any fault is detected, the parking aid switch indicator will flash, then constantly illuminate when the key is transitioned to RUN. The parking aid is on the universal asynchronous receiver-transmitter (UART)-based protocol (UBP) communications network and can be diagnosed with a diagnostic tool.

Instrument Cluster and Panel Illumination Printable View (412 KB)

Refer to Wiring Diagrams Cell 71 , for schematic and connector information.

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052, or equivalent diagnostic tool with the appropriate adaptor cable

Inspection and Verification

NOTE: The instrument cluster and front electronic module (FEM) must be reconfigured upon installation. Refer to Section 418-00 .

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Instrument panel dimmer switch	• Central junction box (CJB) fuse(s) ♦ 4 (5A) ♦ 13 (5A) ♦ 17 (5A) ♦ 20 (10A) ♦ 33 (10A) • Battery junction box (BJB) fuse(s) ♦ 22 (20A) ♦ 25 (40A) • Bulb(s) • Connectors • Central junction box (CJB) • Interior auxiliary junction box

	• Joint connector 3 • Instrument cluster • Front electronic module (FEM) • Instrument panel dimmer switch

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, connect the diagnostic tool to the data link connector and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
   - check that the program card is correctly installed.
   - check the connections to the vehicle.
   - check the ignition switch position.

5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

6. Carry out the diagnostic tool data link test. If the diagnostic tool responds with:
   - SCP+ or SCP- circuit fault; all electronic control units no response/not equipped, refer to Section 418-00 .
   - No response/not equipped for the front electronic module (FEM), REFER to Section 418-00 .
   - No response/not equipped for the instrument cluster, Go To Pinpoint Test F .
   - System passed, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out the self-test diagnostics for the instrument cluster or FEM.

7. If the DTCs retrieved are related to the concern, refer to Section 418-00 to continue diagnostics.

8. If no DTCs related to the concern are retrieved, GO to to continue diagnostics.

Instrument Cluster Diagnostic Trouble Code (DTC) Index

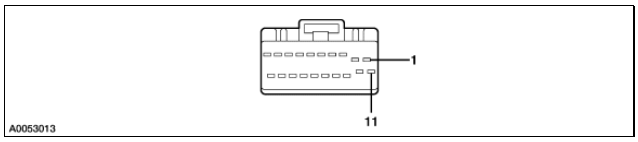
DTC	Description	Source	Action
B1246	Dim Panel Potentiometer Switch Circuit Failure	Instrument Cluster	Go To Pinpoint Test E .

For a complete list of instrument cluster DTCs, refer to Section 418-00 .

Symptom Chart

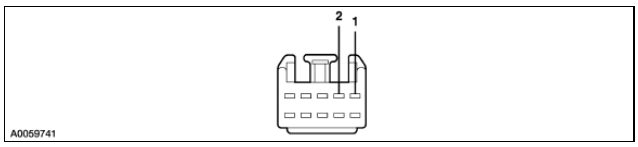
Symptom Chart
Circuit Reference

Front Electronic Module (FEM) C201f



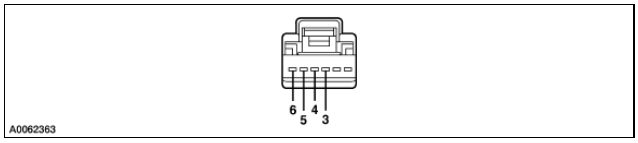
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	29S-DK22 (OG/YE) B+ power feed circuit	0 voltage with the key in the OFF position, greater than 10 volts with the key in the ON position. Less than 5 ohms, with the key in the OFF position, between the FEM and the interior auxiliary junction box. Greater than 10,000 ohms resistance, with the key in the OFF position, between the FEM and ground.
11	64S-LH5 (BU/YE) dimmable backlighting power supply	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the FEM and the interior auxiliary junction box. Greater than 10,000 ohms resistance between the FEM and ground.

Headlamp Switch C205



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	31-LH26 (BK) illumination ground	0 voltage, less than 5 ohms resistance between the headlamp switch and ground.
2	64S-LH26 (BU/BK) dimmable backlighting power supply	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the headlamp switch and the joint connector 3. Greater than 10,000 ohms resistance between the headlamp switch and ground.

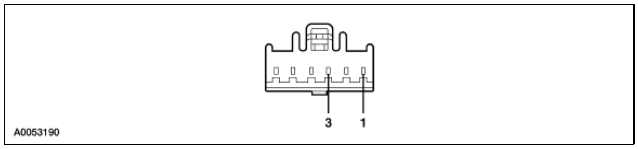
Instrument Panel Dimmer Switch C206



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
3		

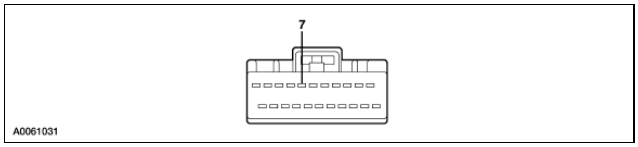
	64S-LE10 (BU/YE) dimmable backlighting power supply	5 volts with the headlamp switch in the PARK/ON positions. Less than 5 ohms resistance between the instrument panel dimming module and the instrument cluster. Greater than 10,000 ohms resistance between the instrument panel dimmer switch and ground.
4	9-LE10 (BN/YE) signal return circuit	0 voltage, less than 5 ohms resistance between the instrument panel dimmer switch and ground.
5	10-LE10 (GY/BK) illumination ground	0 voltage, less than 5 ohms resistance between the instrument panel dimmer switch and ground.
6	8-LE10 (WH/BK) signal circuit	5 volts with the headlamp switch in the PARK/ON positions. Less than 5 ohms resistance between the instrument panel dimmer switch and the instrument cluster. Greater than 10,000 ohms resistance between the instrument panel dimmer switch and ground.

Clockspring C218b



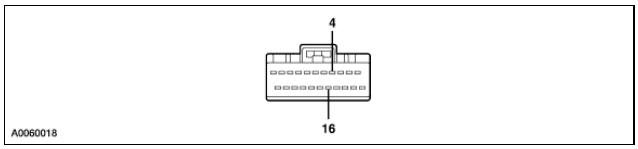
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	64-LK18 (BU/RD) dimmable backlighting power supply	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the clockspring and the joint connector 3. Greater than 10,000 ohms resistance between the clockspring and ground.
3	31S-PG1 (BK/BU) ground	0 voltage, less than 5 ohms resistance between the clockspring and ground.

Instrument Cluster C220a



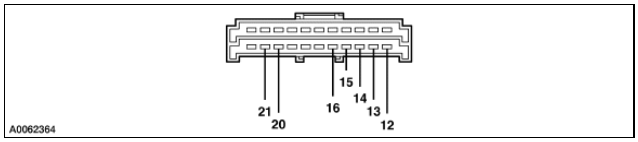
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
7	64S-LK29 (BU/RD) dimmable backlighting power supply to the instrument cluster	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the joint connector 3 and the instrument cluster. Greater than 10,000 ohms resistance between the joint connector 3 and ground.

Instrument Cluster C220c



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
4	9-LE10 (BN/YE) sensor signal return	0 voltage, less than 5 ohms resistance between the instrument cluster and the dimmer switch module. Greater than 10,000 ohms resistance between the instrument cluster and ground.
16	8-LE10 (WH/BK) 5 volt reference signal	0 voltage with the headlamps in the OFF position, 5 volts with the headlamps in the PARK/ON positions.

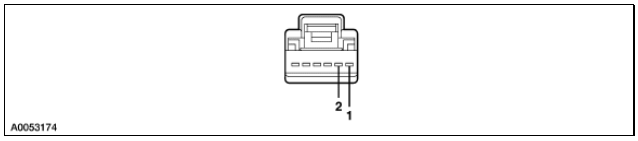
Joint Connector 3 C224



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
12	64S-LE10 (BU/YE) dimmable backlighting power supply to the dimmer switch	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the joint connector 3 and the dimmer switch. Greater than 10,000 ohms resistance between the joint connector 3 and ground.
13	64S-LK1 (BU/RD) dimmable backlighting power	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the joint connector 3 and the interior auxiliary junction box. Greater than 10,000 ohms resistance between the joint connector 3 and ground.
14	64S-AL19 (BU/BK) dimmable backlighting power supply to the adjustable pedal switch	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch

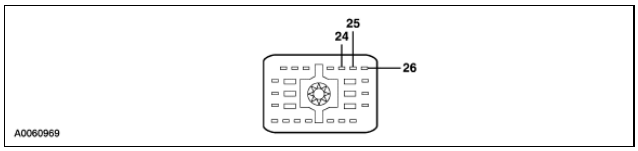
		position. Less than 5 ohms resistance between the joint connector 3 and the adjustable pedal switch. Greater than 10,000 ohms resistance between the joint connector 3 and ground.
15	64S-LK29 (BU/RD) dimmable backlighting power supply to the instrument cluster	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the joint connector 3 and the instrument cluster. Greater than 10,000 ohms resistance between the joint connector 3 and ground.
16	64-LK18 (BU/RD) dimmable backlighting power supply to the steering wheel speed control switch(es)	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the joint connector 3 and the steering wheel speed control switch(es). Greater than 10,000 ohms resistance between the joint connector 3 and ground.
20	64S-LH26 (BU/BK) dimmable backlighting power supply to the headlamp switch	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the joint connector 3 and the headlamp switch. Greater than 10,000 ohms resistance between the joint connector 3 and ground.
21	64S-GG25 (BU/OG) dimmable backlighting power supply to the message center switch	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the joint connector 3 and the message center switch. Greater than 10,000 ohms resistance between the joint connector 3 and ground.

Message Center Switch C253



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	64S-GG25 (BU/OG) dimmable backlighting power supply	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the message center switch and the joint connector 3. Greater than 10,000 ohms resistance between the message center switch and ground.
2	31-GG25 (BK) illumination ground	0 voltage, less than 5 ohms resistance between the message center switch and ground.

Central Junction Box (CJB) C270d



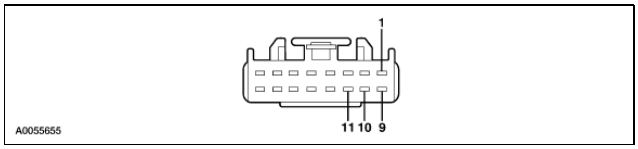
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
24	64S-AD2 (BU/RD) dimmable backlighting power supply to the central junction box (CJB)	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the CJB and the interior auxiliary junction box. Greater than 10,000 ohms resistance between the CJB and ground.
25	64S-LH2 (BU/RD) dimmable backlighting power supply to the passenger side front window control switch and door lock control switches	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the central junction box (CJB) and the front electronic module (FEM). Greater than 10,000 ohms resistance between the CJB and ground.
26	64S-LH33 (BU/BK) dimmable backlighting power supply to the passenger side rear power window control and heated seat switches	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the CJB and the FEM. Greater than 10,000 ohms resistance between the CJB and ground.

Interior Auxiliary Junction Box C283a

	Circuit Designation/Description	Normal Condition/Measurement

Pin Number(s)		
5	64S-LK9 (BU/WH) dimmable backlighting power supply to the following: cigar lighter illumination bulb, transmission selector lever illumination bulb, traction control, parking aid and electronic park brake release switches.	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the interior auxiliary junction box and the following: cigar lighter illumination bulb, transmission selector lever illumination bulb, traction control, parking aid and electronic park brake release switches.
9	64S-LH5 (BU/YE) dimmable backlighting power supply from the front electronic module (FEM).	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the interior auxiliary junction box and the FEM. Greater than 10,000 ohms resistance between the FEM and ground.
13	64S-LH4 (BU/BK) dimmable backlighting power supply from the FEM.	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the interior auxiliary junction box and the FEM. Greater than 10,000 ohms resistance between the FEM and ground.

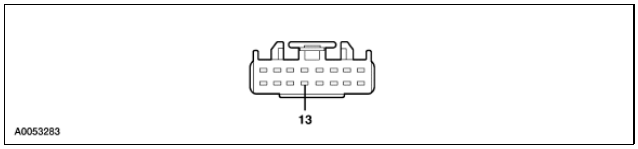
Interior Auxiliary Junction Box C283b



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	64S-LH1 (BU) dimmable backlighting power supply to the following switches: mirror, memory set, driver side window, and door lock.	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the interior auxiliary junction box and the following switches: mirror, memory set, driver side window, and door lock. Greater than 10,000 ohms resistance between the interior auxiliary junction box and ground.
9	64S-LH4 (BU/BK) dimmable backlighting power supply	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the interior auxiliary junction box and the front electronic module (FEM). Greater than 10,000 ohms resistance between the interior auxiliary junction box

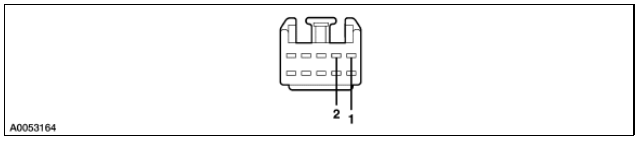
		and ground.
10	64S-LH16 (BU/WH) dimmable backlighting power supply to the driver side rear power window control and heated seat switches	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the interior auxiliary junction box and the driver side rear power window and heated seat switches. Greater than 10,000 ohms resistance between the interior auxiliary junction box and ground.
11	64S-AD2 (BU/RD) dimmable backlighting power supply	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the interior auxiliary junction box and the central junction box (CJB). Greater than 10,000 ohms resistance between the interior auxiliary junction box and ground.

Interior Auxiliary Junction Box C283d



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
13	64S-LK1 (BU/RD) dimmable backlighting power supply	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the interior auxiliary junction box and the joint connector 3. Greater than 10,000 ohms resistance between the interior auxiliary junction box and ground.

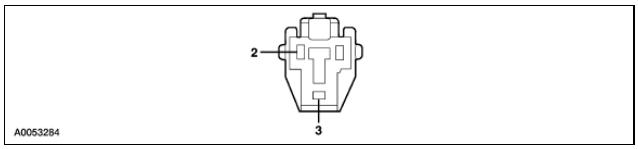
Transmission Selector Lever C307



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	64S-LK21 (BU/BK) dimmable backlighting power supply	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the transmission selector lever illumination and the interior auxiliary junction box.

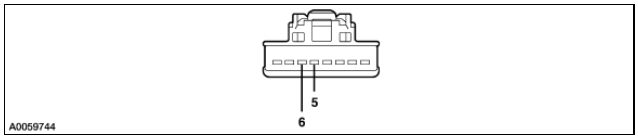
		Greater than 10,000 ohms resistance between the transmission selector lever illumination and ground.
2	31-LK21 (BK/GN) ground	0 voltage, less than 5 ohms resistance between the transmission selector lever illumination ground.

Cigar Lighter C319



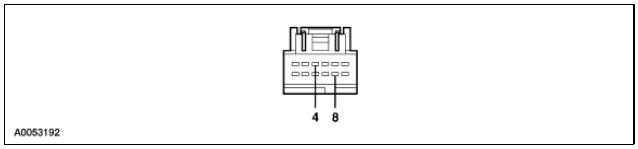
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
2	64S-LK11 (BU) dimmable backlighting power supply	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less the 5 ohms resistance between the cigar lighter illumination and the interior auxiliary junction box. Greater than 10,000 ohms resistance between the cigar lighter illumination and ground.
3	31-LK11 (BK) ground	0 voltage, less than 5 ohms resistance between the cigar lighter illumination and ground.

Memory Set Switch C503



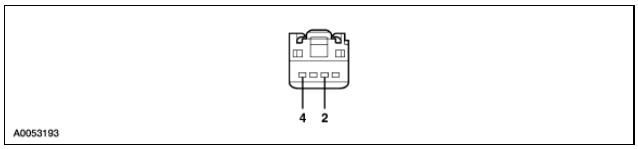
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
5	31-AH27 (BK) ground	0 voltage, less than 5 ohms resistance between the memory set switch and ground.
6	64S-AH27 (BU) dimmable backlighting power supply	0 voltage with headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the memory set switch and the interior auxiliary junction box. Greater than 10,000 ohms resistance between the memory set switch and ground.

LF Window Control Switch C504a



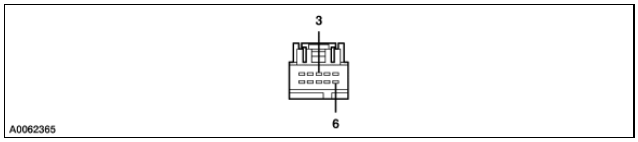
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
4	64S-LH14 (BU) dimmable backlighting power supply	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the LF window control switch and the interior auxiliary junction box. Greater than 10,000 ohms resistance between the LF window control switch and ground.
8	31-AJ7 (BK/BU) ground	0 voltage, less than 5 ohms resistance between the LF window control switch and ground.

Door Lock Control Switch C505 (LF) or C605 (RF)



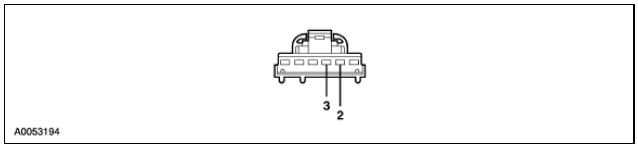
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
(C505) 2	64S-LH28 (BU) dimmable backlighting power supply	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the LF door lock control switch and the interior auxiliary junction box. Greater than 10,000 ohms resistance between the LF door lock control switch and ground.
(C505) 4	31-LH28 (BK) ground	0 voltage, less than 5 ohms resistance between the LF door lock control switch and ground.
(C605) 2	64S-LH42 (BU/RD) dimmable backlighting power supply	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the RF door lock control switch and the central junction box (CJB). Greater than 10,000 ohms resistance between the RF door lock control switch and ground.
(C605) 4	31-LH42 (BK) ground	0 voltage, less than 5 ohms resistance between the RF door lock control switch and ground.

Exterior Mirror Control Switch C527



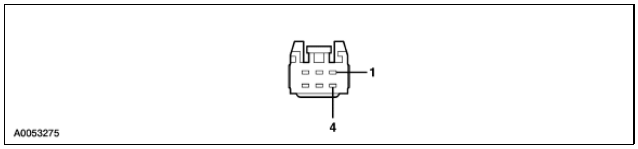
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
3	31-AD12 (BK/YE) illumination ground	0 voltage, less than 5 ohms resistance between the exterior mirror control switch and ground.
6	64S-LH50 (BU/YE) dimmable backlighting power supply	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the exterior mirror control switch and the interior auxiliary junction box. Greater than 10,000 ohms resistance between the exterior mirror control switch and ground.

RF Window Control Switch C604



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
2	64S-LH31 (BU/RD) dimmable backlighting power supply	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the RF window control switch and the central junction box (CJB). Greater than 10,000 ohms resistance between the RF window control switch and ground.
3	31-LH31 (BK) ground	0 voltage, less than 5 ohms resistance between the RF window control switch and ground.

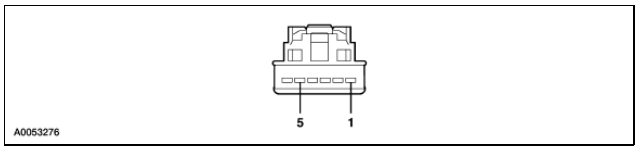
Window Control Switch C701 (LR) and C801 (RR)



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
(C701) 1	31-LH16 (BK/OG) ground	0 voltage, less than 5 ohms resistance between the LR window control switch and ground.
(C701) 4		

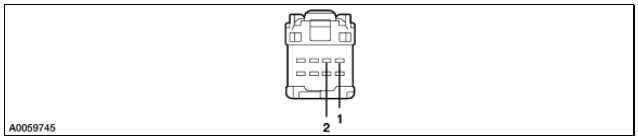
	64S-LH16A (BU/WH) dimmable backlighting power supply	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the LR window control switch and the interior auxiliary junction box. Greater than 10,000 ohms resistance between the LR window control switch and ground.
(C801) 1	31-LH33 (BK/GN) ground	0 voltage, less than 5 ohms resistance between the RR window control switch and ground.
(C801) 4	64S-LH33A (BU/BK) dimmable backlighting power supply	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the RR window control switch and the central junction box (CJB). Greater than 10,000 ohms resistance between the RR window control switch and ground.

Heated Seat Switch C722 (LR) or C822 (RR)



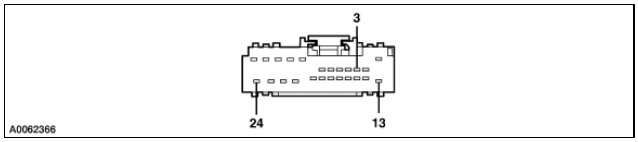
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
(C722) 1	31-HC15 (BK/YE) ground	0 voltage, less than 5 ohms resistance between the LR heated seat switch and ground.
(C722) 5	64S-LH15 (BU) dimmable backlighting power supply	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the LR heated seat switch and the interior auxiliary junction box. Greater than 10,000 ohms resistance between the LR heated seat switch and ground.
(C822) 1	31-HC18 (BK/GN) ground	0 voltage, less than 5 ohms resistance between the RR heated seat switch and ground.
(C822) 5	64S-LH32 (BU/BK) dimmable backlighting power supply	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the RR heated seat switch and the central junction box (CJB). Greater than 10,000 ohms resistance between the RR heated seat switch and ground.

Adjustable Pedal Switch C2089



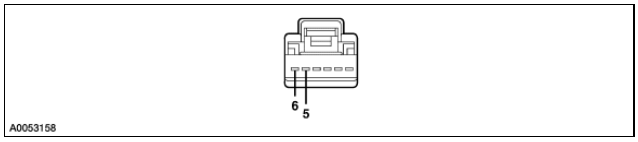
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	31-AL19 (BK/GN) ground	0 voltage, less than 5 ohms resistance between the adjustable pedal switch and ground.
2	64S-AL19 (BU/BK) dimmable backlighting power supply	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the adjustable pedal switch and the joint connector 3. Greater than 10,000 ohms resistance between the adjustable pedal switch and ground.

Vehicle Navigation Radio (VNR) (if equipped) C2253a



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
3	64S-LK34 (BU/BK) dimmable backlighting power supply	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the VNR and the joint connector 3. Greater than 10,000 ohms resistance between the VNR and ground.
13	31-MD15B (BK/GN) ground	0 voltage, less than 5 ohms resistance between the VNR unit and ground.
24	31-MD15A (BK/GN) ground	0 voltage, less than 5 ohms resistance between the VNR unit and ground.

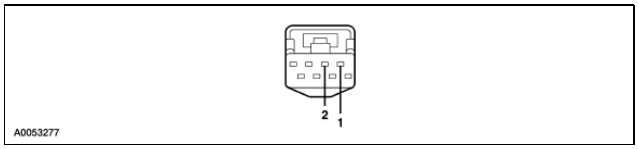
Traction Control (TC) Switch C3208



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
5	31-LH45 (BK/WH) ground	0 voltage, less than 5 ohms resistance between the traction control (TC) switch and ground.
6		

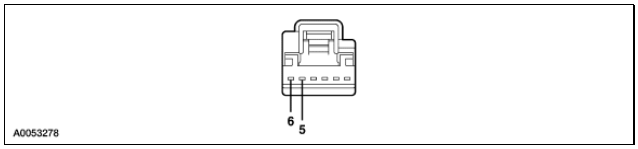
	64S-LH45 (BU/OG) dimmable backlighting power supply	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the TC switch and the interior auxiliary junction box. Greater than 10,000 ohms resistance between the TC switch and ground.

Electronic Park Brake Release Switch C3218



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	64S-CG15 (BU/WH) dimmable backlighting power supply	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the electronic park brake release switch and the interior auxiliary junction box. Greater than 10,000 ohms resistance between the electronic park brake release switch and ground.
2	31-CG15 (BK/OG) ground	0 voltage, less than 5 ohms resistance between the electronic park brake release switch and ground.

Parking Aid Switch C9011



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
5	31-LH49 (BK/GN) ground	0 voltage, less than 5 ohms resistance between the parking aid switch and ground.
6	64S-LH49 (BU/BK) dimmable backlighting power supply	0 voltage with the headlamp switch in the OFF position. Variable voltage between 0 volts and 10 volts with the headlamp switch in the PARK/ON positions, dependent on the panel dimmer switch position. Less than 5 ohms resistance between the parking aid switch and the interior auxiliary junction box. Greater than 10,000 ohms resistance between the parking aid switch and ground.

Pinpoint Test A: One or More Module-Controlled Illumination Source(s) is Inoperative

Normal Operation

The headlamp switch supplies the instrument cluster with the headlamp switch position status. For additional information on the headlamp switch operation, refer to Section 417-01 . The dimmer switch provides the instrument cluster with the dimmer control status through signal circuit 8-LE10 (WH/BK) and return circuit 9-LE10 (BN/YE). The instrument cluster sends the illumination message to the front electronic module (FEM) over the standard corporate protocol (SCP) communication network, circuits 4-EG8 (GY/VT) and 5-EG8 (BU/WH), based upon the dimmer switch position. The FEM is supplied with illumination power through circuit 29S-DK22 (OG/YE) whenever the switched system power (SSP) relay number 2 is energized. For additional information on the SSP operation, refer to Section 417-01 . When the headlamp switch is in the PARK, HEADLAMP, or AUTOLAMP ON position, the instrument cluster sends the FEM an illumination message and the FEM, in turn, provides pulse width modulation (PWM) power to the interior auxiliary junction box through circuit 64S-LH5 (BU/YE). The interior auxiliary junction box separates the PWM power and supplies it to sub-illumination sources through circuits 64S-LH4 (BU/BK), 64S-LH1 (BU), 64S-LK9 (BU/WH), 64S-LH16 (BU/WH), and the central junction box (CJB) through circuit 64S-AD2 (BU/RD). The CJB separates the PWM power and also supplies it to sub-illumination sources through circuits 64S-LH2 (BU/RD) and 64S-LH33 (BU/BK). The sub-illumination sources then provide the PWM power to the individual illuminating sources.

Possible Causes

PINPOINT TEST A: ONE OR MORE MODULE-CONTROLLED ILLUMINATION SOURCE(S) IS INOPERATIVE

Test Step	Result / Action to Take
A1 CHECK IF ONE OR MORE MODULE-CONTROLLED ILLUMINATION SOURCE(S) IS INOPERATIVE	
• Turn the headlamps on. • Place the dimmer switch in the maximum brightness position. • **Is only one illumination component inoperative?**	**Yes** If the DM100i or the CDX6 audio unit is inoperative, INSTALL a new audio unit, REFER to Section 415-00 . All other individual sources inoperative, GO to A2 . **No** If the LR window control switch and the LR heated seat switch illumination controls are inoperative, GO to A4 . If the LF window control switch, the memory set switch, the LF door lock control switch, and the exterior mirror control switch illumination controls are inoperative, GO to A6 , If the RF window control switch

	and the RF door lock control switch illumination controls are inoperative, GO to A8 If the RR window control switch and the RR heated seat switch illumination controls are inoperative, GO to A10 . If the steering wheel controls, the instrument panel dimmer switch, the headlamp switch, the message center switch, the instrument cluster, the adjustable pedal switch, the cigar lighter, the transmission selector lever, the traction control switch, the electronic park brake release switch, and the parking aid switch illumination controls are all inoperative, GO to A14 .
A2 CHECK THE POWER CIRCUIT TO THE ILLUMINATION SOURCE IN QUESTION	
• Turn the headlamps off. • Disconnect the inoperative illumination source connector. • Turn the headlamps on. • Place the dimmer switch in the maximum brightness position. • Measure the voltage between the circuit in question (using the following chart) and ground.	**Yes** GO to A3 . **No** REPAIR the circuit in question. TEST the system for normal operation.

Connector and Pin	Circuit
Headlamp Switch C205-2	circuit 64S-LH26 (BU/BK)
Instrument Panel Dimmer Switch C206-3	circuit 64S-LE10 (BU/YE)
Clockspring C218b-1	circuit 64-LK18 (BU/RD)
Message Center C253-1	circuit 64S-GG25 (BU/OG)
Transmission Selector Lever Illumination C307-1	circuit 64S-LK21 (BU/BK)
Cigar Lighter Illumination C319-2	circuit 64S-LK11 (BU)
Memory Set Switch C503-6	circuit 64S-AH27 (BU)
LF Window Control Switch C504a-4	circuit 64S-LH14 (BU)
	circuit 64S-LH28 (BU)

LF Door Lock Control Switch C505-2	
Exterior Mirror Control Switch C527-6	circuit 64S-LH50 (BU/YE)
RF Window Control Switch C604-2	circuit 64S-LH31 (BU/RD)
RF Door Lock Control Switch C605-2	circuit 64S-LH42 (BU/RD)
LR Window Control Switch C701-4	circuit 64S-LH16A (BU/WH)
LR Heated Seat Switch C722-5	circuit 64S-LH15 (BU)
RR Window Control Switch C801-4	circuit 64S-LH33A (BU/BK)
RR Heated Seat Switch C822-5	circuit 64S-LH32 (BU/BK)
Adjustable Pedal Switch C2089-2	circuit 64S-AL19 (BU/BK)
Vehicle Navigation Radio (VNR) C2253a-3	circuit 64S-LK34 (BU/BK)
Traction Control Switch C3208-6	circuit 64S-LH45 (BU/OG)
Electronic Park Brake Release Switch C3218-1	circuit 64S-CG15 (BU/WH)
Parking Aid Switch C9011-6	circuit 64S-LH49 (BU/BK)

- **Is the voltage greater than 10 volts?**

A3 CHECK THE GROUND CIRCUIT TO THE ILLUMINATION SOURCE IN QUESTION

- Key in OFF position.
- Turn the headlamps off.
- Measure the resistance between the circuit in question (using the following chart) and ground.

Connector and Pin	Circuit
Headlamp Switch C205-1	circuit 31-LH26 (BK)
Instrument Panel Dimmer Switch C206-5	circuit 10-LE10 (GY/BK)
Clockspring C218b-3	circuit 31S-PG1 (BK/BU)
Message Center C253-2	circuit 31-GG25 (BK)
Transmission Selector Lever Illumination C307-2	circuit 31-LK21 (BK/GN)
Cigar Lighter Illumination C319-3	circuit 31-LK11 (BK)

Yes
INSTALL a new component in question.

No
REPAIR the circuit in question. TEST the system for normal operation.

Memory Set Switch C503-5	circuit 31-AH27 (BK)
LF Window Control Switch C504a-8	circuit 31-AJ7 (BK/BU)
LF Door Lock Control Switch C505-4	circuit 31-LH28 (BK)
Exterior Mirror Control Switch C527-3	circuit 31-AD12 (BK/YE)
RF Window Control Switch C604-3	circuit 31-LH31 (BK)
RF Door Lock Control Switch C605-4	circuit 31-LH42 (BK)
LR Window Control Switch C701-1	circuit 31-LH16 (BK/OG)
LR Heated Seat Switch C722-1	circuit 31-HC15 (BK/YE)
RR Window Control Switch C801-1	circuit 31-LH33 (BK/GN)
RR Heated Seat Switch C822-1	circuit 31-HC18 (BK/GN)
Adjustable Pedal Switch C2089-1	circuit 31-AL19 (BK/GN)
Vehicle Navigation Radio (VNR) C2253a-13, C2253a-24	circuits 31-MD15B (BK/GN), 31-MD15A (BK/GN)
Traction Control Switch C3208-5	circuit 31-LH45 (BK/WH)
Electronic Park Brake Release Switch C3218-2	circuit 31-CG15 (BK/OG)
Parking Aid Switch C9011-5	circuit 31-LH49 (BK/GN)

- **Is the resistance less than 5 ohms?**

A4 CHECK CIRCUIT 64S-LH16A (BU/WH) FOR POWER	
• Disconnect: LR Window Control Switch C701. • Turn the headlamps on. • Place the dimmer switch in the maximum brightness position. • Measure the voltage between the LR window control switch C701-4, circuit 64S-LH16A (BU/WH), harness side and ground.  A0060885 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR ground circuit 31-LH16 (BK/OG). TEST the system for normal operation. **No** GO to A5

A5 CHECK CIRCUIT 64S-LH16 (BU/WH) FOR AN OPEN	
• Turn the headlamps off. • Disconnect: Interior Auxiliary Junction Box C283b. • Measure the resistance between the LR window control switch C701-4, circuit 64S-LH16A (BU/WH), harness side and interior auxiliary junction box C283b-10, circuit 64S-LH16 (BU/WH), harness side.  A0060886 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR or INSTALL and new interior auxiliary junction box. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
A6 CHECK CIRCUIT 64S-LH14 (BU) FOR POWER	
• Disconnect: LF Window Control Switch C504a. • Turn the headlamps on. • Place the dimmer switch in the maximum brightness position. • Measure the voltage between the LF window control switch C504a-4, circuit 64S-LH14 (BU), harness side and ground.  A0060887 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR ground circuit 31-LH1 (BK/YE). TEST the system for normal operation. **No** GO to A7 .
A7 CHECK CIRCUIT 64S-LH1 (BU) FOR AN OPEN	
• Turn the headlamps off. • Disconnect: Interior Auxiliary Junction Box C283b. • Measure the resistance between the LF window control switch C504a-4, circuit 64S-LH14 (BU), harness side and the interior auxiliary junction box C283b-1, circuit 64S-LH1 (BU), harness side.  A0060888 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR or INSTALL a new interior auxiliary junction box. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
A8 CHECK CIRCUIT 64S-LH31 (BU/RD) FOR POWER	

• Disconnect: RF Window Control Switch C604. • Turn the headlamps on. • Place the dimmer switch in the maximum brightness position. • Measure the voltage between the RF window control switch C604-2, circuit 64S-LH31 (BU/RD), harness side and ground.  A0060889 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR ground circuit 31-LH2 (BK/BU). TEST the system for normal operation. **No** GO to A9 .
A9 CHECK CIRCUIT 64S-LH2 (BU/RD) FOR AN OPEN	
• Turn the headlamps off. • Disconnect: Central Junction Box (CJB) C270d. • Measure the resistance between the RF window control switch C604-2, circuit 64S-LH31 (BU/RD), harness side and the CJB C270d-25, circuit 64S-LH2 (BU/RD), harness side.  A0060890 • **Is the resistance less than 5 ohms?**	**Yes** GO to A12 . **No** REPAIR the circuit. TEST the system for normal operation.
A10 CHECK CIRCUIT 64S-LH33A (BU/BK) FOR POWER	
• Disconnect: RR Window Control Switch C801. • Turn the headlamps on. • Place the dimmer switch in the maximum brightness position. • Measure the voltage between the RR window control switch C801-4, circuit 64S-LH33A (BU/BK), harness side and ground.  A0060885 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR ground circuit 31-LH33 (BK/GN). TEST the system for normal operation. **No** GO to A11 .
A11 CHECK CIRCUIT 64S-LH33 (BU/BK) FOR AN OPEN	

• Turn the headlamps off. • Disconnect: Central Junction Box (CJB) C270d. • Measure the resistance between the RR window control switch C801-4, circuit 64S-LH33A (BU/BK), harness side and the CJB C270d-26, circuit 64S-LH33 (BU/BK), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to A12 . **No** REPAIR the circuit. TEST the system for normal operation.
A12 CHECK CIRCUIT 64S-AD2 (BU/RD) FOR POWER	
• Connect: CJB 270d. • Disconnect: Interior Auxiliary Junction Box (CJB) C283b. • Turn the headlamps on. • Place the dimmer switch in the maximum brightness position. • Measure the voltage between the interior auxiliary junction box C283b-11, circuit 64S-AD2 (BU/RD), component side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to A13 **No** REPAIR or INSTALL a new interior auxiliary junction box.
A13 CHECK CIRCUIT 64S-AD2 (BU/RD) FOR AN OPEN	
• Turn the headlamps off. • Disconnect: CJB C270d. • Measure the resistance between the interior auxiliary junction box C283b-11, circuit 64S-AD2 (BU/RD), harness side and the central junction box (CJB) C270d-24, circuit 64S-AD2 (BU/RD), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** REPAIR or INSTALL a new CJB. **No** REPAIR the circuit. TEST the system for normal operation.
A14 CHECK INTERIOR AUXILIARY JUNCTION BOX ILLUMINATION	

• Disconnect: Interior Auxiliary Junction Box C283b. • Turn the headlamps on. • Place the dimmer switch in the maximum brightness position. • Measure the voltage between the interior auxiliary junction box C283b-9, circuit 64S-LH4 (BU/BK), component side and ground.  A0060893 • **Is the voltage greater than 10 volts?**	**Yes** GO to A15 **No** REPAIR or INSTALL a new interior auxiliary junction box. TEST the system for normal operation.
A15 CHECK CIRCUIT 64S-LH4 (BU/BK) FOR AN OPEN	
• Turn the headlamps off. • Disconnect: Interior Auxiliary Junction Box C283a. • Measure the resistance between the central junction box (CJB) C283b-9, circuit 64S-LH4 (BU/BK), harness side and the CJB C283a-13, circuit 64S-LH4 (BU/BK), harness side.  A0060894 • **Is the resistance less than 5 ohms?**	**Yes** GO to A16 . **No** REPAIR the circuit. TEST the system for normal operation.
A16 CHECK THE INTERIOR AUXILIARY JUNCTION BOX FOR AN OPEN	
• Disconnect: Interior Auxiliary Junction Box C283d. • Measure the resistance between the interior auxiliary junction box C283a-13, circuit 64S-LH4 (BU/BK), component side, and the interior auxiliary junction box C283d-13, circuit 64S-LK1 (BU/RD), component side; and between the interior auxiliary junction box C283a-13, circuit 64S-LH4 (BU/BK), component side and the interior auxiliary junction box C283a-5, circuit 64S-LK9 (BU/WH), component side.  A0060963 • **Are the resistances less than 5 ohms?**	**Yes** If the adjustable pedal switch, instrument cluster, message center, headlamp switch, instrument panel dimmer switch, steering wheel controls and vehicle navigation radio VNR (if equipped) illumination controls are inoperative, GO to A17 . If the cigar lighter, the transmission selector lever, the traction control switch, the electronic park brake release switch and the parking aid switch illumination controls are inoperative, REPAIR circuit 64S-LK9 (BU/WH). If the cigar lighter, the transmission selector lever and the traction control switch illumination controls

	are inoperative, REPAIR circuits 31-LK11 (BK), 31-LK21 (BK/GN) and 31-DA1 (BK/YE). TEST the system for normal operation. **No** REPAIR or INSTALL a new interior auxiliary junction box. TEST the system for normal operation.
A17 CHECK CIRCUIT 64S-LK1 (BU/RD) FOR OPEN	
• Disconnect: Joint Connector 3 C224. • Measure the resistance between the interior auxiliary junction box C283d-13, circuit 64S-LK1 (BU/RD), harness side, and the joint connector 3 C224-13, circuit 64S-LK1 (BU/RD), harness side.  A0060964 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR or INSTALL a new joint connector 3. **No** REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test B: The Control Illumination Is Inoperative

Normal Operation

The headlamp switch supplies the instrument cluster with the headlamp switch position status. For additional information on the headlamp switch operation, refer to Section 417-01 . The dimmer switch provides the instrument cluster with the dimmer control status through signal circuit 8-LE10 (WH/BK) and return circuit 9-LE10 (BN/YE). The instrument cluster sends the illumination message to the front electronic module (FEM) over the standard corporate protocol (SCP) communication network, circuits 4-EG8 (GY/VT) and 5-EG8 (BU/WH), based upon the dimmer switch position. The FEM is supplied with illumination power through circuit 29S-DK22 whenever the switched system power (SSP) is energized. For additional information on the SSP operation, refer to Section 417-01 . When the headlamp switch is in the PARK, HEADLAMP, or AUTOLAMP ON position, the instrument cluster sends the FEM an illumination message and the FEM, in turn, provides pulse width modulation (PWM) power to the interior auxiliary junction box through circuit 64S-LH5 (BU/YE). The interior auxiliary junction box separates the PWM power and supplies it to sub-illumination sources through circuits 64S-LH4 (BU/BK), 64S-LH1 (BU), 64S-LK9 (BU/WH), 64S-LH16 (BU/WH), 64S-LH1 (BU), and the central junction box (CJB) through circuit 64S-AD2 (BU/RD). The CJB separates the PWM power and also supplies it to the sub-illumination sources through circuits 64S-LH2 (BU/RD) and 64S-LH33 (BU/BK). The sub-illumination sources then provide the PWM power to the individual illuminating sources.

Possible Causes

- circuit 29S-DK22 (OG/YE) open or short to ground
- circuit 64S-AD2 (BU/RD) short to ground
- circuit 64S-AH27 (BU) short to ground
- circuit 64S-AL19 (BU/BK) short to ground
- circuit 64S-CG15 (BU/WH) short to ground

- circuit 64S-GG25 (BU/OG) short to ground
- circuit 64S-LE10 (BU/YE) short to ground
- circuit 64S-LH1 (BU) short to ground
- circuit 64S-LH2 (BU/RD) short to ground
- circuit 64S-LH3 (BU/WH) short to ground
- circuit 64S-LH4 (BU/BK) short to ground
- circuit 64S-LH5 (BU/YE) open or short to ground
- circuit 64S-LH14 (BU) short to ground
- circuit 64S-LH15 (BU) short to ground
- circuit 64S-LH16 (BU/WH) short to ground
- circuit 64S-LH16A (BU/WH) short to ground
- circuit 64S-LH26 (BU/BK) short to ground
- circuit 64S-LH28 (BU) short to ground
- circuit 64S-LH31 (BU/RD) short to ground
- circuit 64S-LH32 (BU/BK) short to ground
- circuit 64S-LH33A (BU/BK) short to ground
- circuit 64S-LH33 (BU/BK) short to ground
- circuit 64S-LH42 (BU/RD) short to ground
- circuit 64S-LH45 (BU/OG) short to ground
- circuit 64S-LH49 (BU/BK) short to ground

- circuit 64S-LK34 (BU/BK) short to ground
- CJB
- interior auxiliary junction box
- instrument cluster
- FEM

PINPOINT TEST B: THE CONTROL ILLUMINATION IS INOPERATIVE

Test Step	Result / Action to Take
B1 CHECK CIRCUIT 64S-LH5 (BU/YE) FOR POWER	
• Disconnect: Interior Auxiliary Junction Box C283a. • Turn the headlamps on. • Place the dimmer switch in the maximum brightness position. • Measure the voltage between the interior auxiliary junction box C283a-9, circuit 64S-LH5 (BU/YE), harness side and ground.  A0059726	**Yes** GO to B2 . **No** GO to B12 .

• **Is the voltage greater than 10 volts?**	
B2 CHECK THE INTERIOR AUXILIARY JUNCTION BOX FOR OPEN OR SHORT TO GROUND	
• Turn the headlamps off. • Disconnect: Interior Auxiliary Junction Box C283b. • Disconnect: Interior Auxiliary Junction Box C283d. • Measure the resistance between the interior auxiliary junction box C283a-9, circuit 64S-LH5 (BU/YE), component side and the interior auxiliary junction box C283b-9, circuit 64S-LH4 (BU/BK), component side; and between the interior auxiliary junction box C283a-9, circuit 64S-LH5 (BU/YE), component side and ground.  A0059759 • **Is the resistance less than 5 ohms between the interior auxiliary junction box pins; and greater than 10,000 ohms between the interior auxiliary junction box and ground?**	**Yes** GO to B3 . **No** REPAIR or INSTALL a new interior auxiliary junction box. TEST the system for normal operation.
B3 CHECK CIRCUIT 64S-LH4 (BU/BK) FOR SHORT TO GROUND	
• Measure the resistance between the interior auxiliary junction box C283b-9, circuit 64S-LH4 (BU/BK), harness side and ground.  A0059728 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B4 . **No** REPAIR the circuit. TEST the system for normal operation.
B4 CHECK THE INTERIOR AUXILIARY JUNCTION BOX FOR SHORT TO GROUND	
• Measure the resistance between the interior auxiliary junction box C283a-13, circuit 64S-LH4 (BU/BK), component side and ground.  A0059760 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B5 . **No** REPAIR or INSTALL a new interior auxiliary junction box. TEST the system for normal operation.

B5 CHECK CIRCUIT 64S-LK9 (BU/WH) FOR SHORT TO GROUND	
• Connect a fused (5A) jumper wire between the interior auxiliary junction box C283a-9, circuit 64S-LH4 (BU/BK), harness side and interior auxiliary junction box C283a-5, circuit 64S-LK9 (BU/WH), harness side.  A0059761 • Turn the headlamps on. • Place the dimmer switch in the maximum brightness position. • Monitor the cigar lighter, transmission selector lever, traction control (TC) switch, electronic park brake release switch and parking aid switch. • **Does the cigar lighter, transmission selector lever, TC switch, electronic park brake release switch and parking aid switch illuminate?**	**Yes** GO to B6 . **No** REPAIR the followings circuit(s): 64S-LK11 (BU), 64S-LK21 (BU/BK), 64S-LH3 (BU/WH), 64S-LH45 (BU/OG), 64S-CG15 (BU/WH), 64S-LH49 (BU/BK), or 64S-LK9 (BU/WH) for short to ground. TEST the system for normal operation.
B6 CHECK THE ILLUMINATION POWER SUPPLY FOR A SHORT TO GROUND	
• Turn the headlamps off. • Connect a fused (5A) jumper wire between the interior auxiliary junction box C283a-9, circuit 64S-LH4 (BU/BK), harness side and interior auxiliary junction box C283d-13, circuit 64S-LK1 (BU/RD), harness side.  A0059758 • Turn the headlamps on. • Place the dimmer switch in the maximum brightness position. • Monitor the adjustable pedal switch, vehicle navigation radio (VNR), instrument cluster, message center, headlamp switch, instrument panel dimmer switch and the steering wheel controls. • **Does the adjustable pedal switch, vehicle navigation radio (VNR), instrument cluster, message center, headlamp switch, instrument panel dimmer switch and the steering wheel controls illuminate?**	**Yes** GO to B7 . **No** REPAIR the following circuit(s): 64S-LK1 (BU/RD), 64S-AL19 (BU/BK), 64S-LK34 (BU/BK), 64S-LK29 (BU/RD), 64S-GG25 (BU/OG), 64S-LH26 (BU/BK), 64S-LE10 (BU/YE), or 64-LK18 (BU/RD) for short to ground. TEST the system for normal operation.
B7 CHECK CIRCUIT 64S-AD2 (BU/RD) FOR SHORT TO GROUND	

• Turn the headlamps off. • Disconnect: Central Junction Box (CJB) C270d. • Measure the resistance between the interior auxiliary junction box C283b-11, circuit 64S-AD2 (BU/RD), harness side and ground.  A0059757 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B8 . **No** REPAIR the circuit. TEST the system for normal operation.
B8 CHECK THE LR HEATED SEAT SWITCH AND LR WINDOW CONTROL SWITCH ILLUMINATION	
• Connect: CJB 270d. • Connect a fused (5A) jumper wire between the interior auxiliary junction box C283a-9, circuit 64S-LH5 (BU/YE), harness side and the interior auxiliary junction box C283b-10, circuit 64S-LH16 (BU/WH), harness side.  A0059730 • Turn the headlamps on. • Place the dimmer switch in the maximum brightness position. • Monitor the LR heated seat switch and LR window control switch illumination. • **Does the LR heated seat switch and the LR window control switch illumination operate?**	**Yes** GO to B9 . **No** REPAIR the following circuit(s): 64S-LH16 (BU/WH), 64S-LH16A (BU/WH) or 64S-LH15 (BU) for short to ground. TEST the system for normal operation.
B9 CHECK THE LF SWITCH ILLUMINATION	
• Turn the headlamps off. • Connect a fused (5A) jumper wire between the interior auxiliary junction box C283a-9, circuit 64S-LH5 (BU/YE), harness side and the interior auxiliary junction box C283b-1, circuit 64S-LH1 (BU), harness side.  A0059729 • Turn the headlamps on. • Place the dimmer switch in the maximum brightness position.	**Yes** GO to B10 . **No** REPAIR the following circuit(s): 64S-LH1 (BU), 64S-LH14 (BU), 64S-AH27 (BU), 64S-LH28 (BU), or 64S-LH50 (BU/YE) for short to ground. TEST the system for normal operation.

• Monitor the LF door window control switch, LF door lock control switch, memory set switch and exterior mirror control switch illumination. • **Does the LF door window control switch, LF door lock control switch, memory set switch and exterior mirror control switch illumination operate?**	
B10 CHECK THE RF HEATED SEAT AND RF WINDOW CONTROL SWITCH ILLUMINATION	
• Turn the headlamps off. • Reconnect: central junction box (CJB) C270d. • Disconnect: RF Door C611. • Connect a fused (5A) jumper wire between the interior auxiliary junction box C283a-9, circuit 64S-LH5 (BU/YE), harness side and the interior auxiliary junction box C283b-11, circuit 64S-AD2 (BU/RD), harness side.  A0060966 • Turn the headlamps on. • Place the dimmer switch in the maximum brightness position. • Monitor the RR heated seat and RR window control switch illumination. • **Does the RR heated seat and RR window control switch illumination operate?**	**Yes** REPAIR the following circuit(s): 64S-LH2 (BU/RD), 64S-LH31 (BU/RD), or 64S-LH42 (BU/RD) for a short to ground. TEST the system for normal operation. **No** GO to B11 .
B11 CHECK THE CENTRAL JUNCTION BOX (CJB) FOR SHORT TO GROUND	
• Turn the headlamps off. • Disconnect: CJB C270d. • Measure the resistance between the CJB C270d-24, circuit 64S-AD2 (BU/RD), component side and ground.  A0060967 • **Is the resistance greater than 10,000 ohms?**	**Yes** REPAIR the following circuit(s): 64S-LH33 (BU/BK), 64S-LH33A (BU/BK), 64S-LH32 (BU/BK) for short to ground. TEST the system for normal operation. **No** REPAIR or INSTALL a new CJB. TEST the system for normal operation.
B12 CHECK CIRCUIT 29S-DK22 (OG/YE) FOR POWER	
• Turn the headlamps off. • Disconnect: Front Electronic Module (FEM) C201f. • Measure the voltage between the FEM C201f-1, circuit 29S-DK22 (OG/YE), harness side and ground.	**Yes** GO to B13 . **No** REPAIR the circuit. TEST the system for normal operation.

 A0004436 • **Is the voltage greater than 10 volts?**	
B13 CHECK CIRCUIT 64S-LH5 (BU/YE) FOR OPEN OR SHORT TO GROUND	
• Measure the resistance between the interior auxiliary junction box C283a-9, circuit 64S-LH5 (BU/YE), harness side and the FEM C201f-11, circuit 64S-LH5 (BU/YE), harness side; and between the interior auxiliary junction box C283a-9, circuit 64S-LH5 (BU/YE), harness side and ground.  A0060968 • **Is the resistance less than 5 ohms between the interior auxiliary junction box and the FEM; and greater than 10,000 ohms between the interior auxiliary junction box and ground?**	**Yes** GO to B14 . **No** REPAIR the circuit. TEST the system for normal operation.
B14 CHECK FOR CORRECT FEM OPERATION	

• Disconnect all the FEM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the FEM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FEM. REFER to Section 418-00 . TEST the system for normal operation. If the control illumination is still inoperative, GO to B15 .
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

B15 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded

	connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: The Control Illumination Is Always On

Normal Operation

The headlamp switch supplies the instrument cluster with the headlamp switch position status. For additional information on the headlamp switch operation, refer to Section 417-01 . The dimmer switch provides the instrument cluster with the dimmer control status through signal circuit 8-LE10 (WH/BK) and return circuit 9-LE10 (BN/YE). The instrument cluster sends the illumination message to the front electronic module (FEM) over the standard corporate protocol (SCP) communication network, circuits 4-EG8 (GY/VT) and 5-EG8 (BU/WH), based upon the dimmer switch position. The FEM is supplied with illumination power through circuit 29S-DK22 whenever the switched system power (SSP) is energized. For additional information on the SSP operation, refer to Section 417-01 . When the headlamp switch is in the PARK, HEADLAMP, or AUTOLAMP ON position, the instrument cluster sends the FEM an illumination message and the FEM, in turn, provides a pulse width modulation (PWM) power to the interior auxiliary junction box through circuit 64S-LH5 (BU/YE). The interior auxiliary junction box separates the PWM power and supplies it to sub-illumination sources through circuits 64S-LH4 (BU/BK), 64S-LH1 (BU), 64S-LK9 (BU/WH), 64S-LH16 (BU/WH), 64S-LH1 (BU), and the central junction box (CJB) through circuit 64S-AD2 (BU/RD). The CJB separates the PWM power and also supplies it to the sub-illumination sources through circuits 64S-LH2 (BU/RD) and 64S-LH33 (BU/BK). The sub-illumination sources then provide the PWM power to the individual illuminating sources. If the dimmer switch signal and return circuits or the dimmer switch are open, the instrument cluster will default the FEM to maximum intensity.

Possible Causes

- circuit 64-LK18 (BU/RD) short to power
- circuit 64S-AD2 (BU/RD) short to power
- circuit 64S-AH27 (BU) short to power
- circuit 64S-AL19 (BU/BK) short to power
- circuit 64S-CG15 (BU/WH) short to power
- circuit 64S-GG25 (BU/OG) short to power
- circuit 64S-LE10 (BU/YE) short to power
- circuit 64S-LH1 (BU) short to power
- circuit 64S-LH2 (BU/RD) short to power
- circuit 64S-LH3 (BU/WH) short to power
- circuit 64S-LH4 (BU/BK) short to power
- circuit 64S-LH5 (BU/YE) short to power
- circuit 64S-LH14 (BU) short to power
- circuit 64S-LH15 (BU) short to power
- circuit 64S-LH16 (BU/WH) short to power
- circuit 64S-LH16A (BU/WH) short to power
- circuit 64S-LH26 (BU/BK) short to power
- circuit 64S-LH28 (BU) short to power
- circuit 64S-LH31 (BU/RD) short to power
- circuit 64S-LH32 (BU/BK) short to power
- circuit 64S-LH33A (BU/BK) short to power
- circuit 64S-LH33 (BU/BK) short to power
- circuit 64S-LH42 (BU/RD) short to power
- circuit 64S-LH45 (BU/OG) short to power
- circuit 64S-LH49 (BU/BK) short to power
- circuit 64S-LH50 (BU/YE) short to power
- circuit 64S-LK1 (BU/RD) short to power
- circuit 64S-LK9 (BU/WH) short to power

- circuit 64S-LK11 (BU) short to power
- circuit 64S-LK21 (BU/BK) short to power
- circuit 64S-LK29 (BU/RD) short to power
- circuit 64S-LK34 (BU/BK) short to power
- CJB
- interior auxiliary junction box
- joint connector 3
- FEM

PINPOINT TEST C: THE CONTROL ILLUMINATION IS ALWAYS ON

Test Step	Result / Action to Take
C1 CHECK THE OPERATION OF THE FEM	
• Disconnect: Front Electronic Module (FEM) C201f. • **Does the illumination go out?**	**Yes** GO to C12 . **No** GO to C2 .
C2 CHECK CIRCUIT 64S-LH5 (BU/YE) FOR SHORT TO POWER	
• Disconnect: Interior Auxiliary Junction Box C283a. • Measure the voltage between the interior auxiliary junction box C283a-9, circuit 64S-LH5 (BU/YE), harness side and ground.  A0059726 • **Is any voltage indicated?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to C3 .
C3 CHECK THE INTERIOR AUXILIARY JUNCTION BOX FOR SHORT TO POWER	
• Disconnect: Interior Auxiliary Junction Box C283b. • Disconnect: Interior Auxiliary Junction Box C283d. • Measure the voltage between the interior auxiliary junction box C283a-9, circuit 64S-LH5 (BU/YE), component side and ground.  A0060893 • **Is any voltage indicated?**	**Yes** REPAIR or INSTALL a new interior auxiliary junction box. TEST the system for normal operation. **No** If the instrument cluster and instrument panel switches remain illuminated, GO to C4 . If the door and window switches remain illuminated, GO to C7 .

C4 CHECK THE SUPPLY CIRCUIT 64S-LH4 (BU/BK) FOR SHORT TO POWER	
• Measure the voltage between the interior auxiliary junction box C283b-9, circuit 64S-LH4 (BU/BK), harness side and ground.  A0059726 • **Is any voltage indicated?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to C5 .
C5 CHECK ILLUMINATION SUPPLY CIRCUIT FOR SHORT TO POWER	
• Measure the voltage between the interior auxiliary junction box C283a-13, circuit 64S-LH4 (BU/BK), component side and ground.  A0061963 • **Is any voltage indicated?**	**Yes** REPAIR or INSTALL a new interior auxiliary junction box. TEST the system for normal operation. **No** GO to C6 .
C6 CHECK THE SUPPLY CIRCUITS FOR SHORT TO POWER	
• Disconnect: Joint Connector 3 C224. • Measure the voltage between the joint connector 3 C224, harness side and ground as follows:	**Yes** REPAIR the circuit(s) in question for short to power. TEST the system for normal operation. **No** REPAIR or INSTALL a new joint connector 3.

Joint Connector 3	Circuit	Component
C224-16	64-LK18 (BU/RD)	Steering wheel switch
C224-12	64S-LE10 (BU/YE)	Instrument panel dimmer switch
C224-20	64S-LH26 (BU/BK)	Headlamp switch
C224-21	64S-GG25 (BU/OG)	Message center switch
C224-15	64SLK29 (BU/RD)	Instrument cluster
C224-3		

	64S-LK34 (BU/BK)	Vehicle navigation radio (VNR)
C224-14	64S-AL19 (BU/BK)	Adjustable pedal switch
C224-13	64S-LK1 (BU/RD)	Illumination supply

- **Is any voltage indicated?**

C7 CHECK CIRCUIT 64S-LH16 (BU/WH) FOR SHORT TO POWER	
• Measure the voltage between the interior auxiliary junction box C283b-10, circuit 64S-LH16 (BU/WH), harness side and ground.  A0059731 • **Is any voltage indicated?**	**Yes** REPAIR the following circuit(s): 64S-LH16 (BU/WH), 64S-LH16A (BU/WH) or 64S-LH15 (BU) for short to power. TEST the system for normal operation. **No** GO to C8 .
C8 CHECK CIRCUIT 64S-LH1 (BU) FOR SHORT TO POWER	
• Measure the voltage between the interior auxiliary junction box C283b-1, circuit 64S-LH1 (BU), harness side and ground.  A0059733 • **Is any voltage indicated?**	**Yes** REPAIR the following circuit(s): 64S-LH1 (BU), 64S-LH14 (BU), 64S-AH27 (BU), 64S-LH28 (BU), or 64S-LH50 (BU/YE) for short to power. TEST the system for normal operation. **No** GO to C9 .
C9 CHECK CIRCUIT 64S-AD2 (BU/RD) FOR SHORT TO POWER	
• Disconnect: Central Junction Box (CJB) C270d. • Measure the voltage between the interior auxiliary junction box C283b-11, circuit 64S-AD2 (BU/RD), harness side and ground.  A0005092 • **Is any voltage indicated?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to C10 .

C10 CHECK CIRCUIT 64S-AD2 (BU/RD) FOR SHORT TO POWER	
• Measure the voltage between the CJB C270d-25, circuit 64S-LH2 (BU/RD), harness side and ground.  • **Is any voltage indicated?**	**Yes** REPAIR the following circuit(s): 64S-LH2 (BU/RD), 64S-LH31 (BU/BK), or 64S-LH42 (BU/RD) for short to power. TEST the system for normal operation. **No** GO to C11 .
C11 CHECK CIRCUIT 64S-LH33 (BU/BK) FOR SHORT TO POWER	
• Measure the voltage between the CJB C270d-26, circuit 64S-LH33 (BU/BK), harness side and ground.  • **Is any voltage indicated?**	**Yes** REPAIR the following circuit(s): 64S-LH33 (BU/BK), 64S-LH33A (BU/BK), or 64S-LH32 (BU/BK) for short to power. TEST the system for normal operation. **No** REPAIR or INSTALL a new CJB. TEST the system for normal operation.
C12 CHECK FOR CORRECT FEM OPERATION	

• Disconnect all the FEM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the FEM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FEM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: The Instrument Cluster Illumination Is Inoperative

Normal Operation

The headlamp switch supplies the instrument cluster with the headlamp switch position status. For additional information on the headlamp switch operation, refer to Section 417-01 . The dimmer switch provides the instrument cluster with the dimmer control status through signal circuit 8-LE10 (WH/BK) and return circuit 9-LE10 (BN/YE). The instrument cluster sends the illumination message to the front electronic module (FEM) over the standard corporate protocol (SCP) communication network, circuits 4-EG8 (GY/VT) and 5-EG8 (BU/WH), based upon the dimmer switch position. The FEM is supplied with illumination power through circuit 29S-DK22 whenever the switched system power (SSP) is energized. For additional information on the SSP operation, refer to Section 417-01 . When the headlamp switch is in the PARK, HEADLAMP, or AUTOLAMP ON position, the instrument cluster sends the FEM an illumination message and the FEM, in turn, provides a pulse width modulation (PWM) power to the interior auxiliary junction box through circuit 64S-LH5 (BU/YE). The interior auxiliary junction box separates the PWM power and supplies it to joint connector 3 through circuit 64S-LH1 (BU) and from joint connector 3 to the instrument cluster

through circuit 64S-LK29 (BU/RD. The instrument cluster is grounded by circuit 31-A11 (BK).

Possible Causes

- instrument cluster
- circuit 31-A11 (BK) open
- circuit 64S-LK29 (BU/RD) open or shorted

PINPOINT TEST D: THE INSTRUMENT CLUSTER ILLUMINATION IS INOPERATIVE

Test Step	Result / Action to Take
⚠ CAUTION: Use the correct probe adaptor(s) when making measurements. Failure to use the correct probe adaptor(s) may damage the connector.	
D1 CHECK THE ILLUMINATION FEED CIRCUIT FOR VOLTAGE	
• Disconnect: Instrument Cluster C220a. • Key in ON position. • Turn the headlamps on. • Place the dimmer switch in the maximum brightness position. • Measure the voltage between the instrument cluster C220a-7, circuit 64S-LK29 (BU/RD), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to D2 . **No** REPAIR the circuit. TEST the system for normal operation.
D2 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTC's. REPEAT the self-test.

Pinpoint Test E: The Instrument Panel Illumination Does Not Dim

Normal Operation

The headlamp switch supplies the instrument cluster with the headlamp switch position status. For additional information on the headlamp switch operation, refer to Section 417-01 . The dimmer switch provides the

instrument cluster with the dimmer control status through signal circuit 8-LE10 (WH/BK) and return circuit 9-LE10 (BN/YE). The instrument cluster sends the illumination message to the front electronic module (FEM) over the standard corporate protocol (SCP) communication network, circuits 4-EG8 (GY/VT) and 5-EG8 (BU/WH), based upon the dimmer switch position. The FEM is supplied with illumination power through circuit 29S-DK22 whenever the switched system power (SSP) is energized. For additional information on the SSP operation, refer to Section 417-01 . When the headlamp switch is in the PARK, HEADLAMP, or AUTOLAMP ON position, the instrument cluster sends the FEM an illumination message and the FEM, in turn, provides pulse width modulation (PWM) power to the interior auxiliary junction box through circuit 64S-LH5 (BU/YE). The interior auxiliary junction box separates the PWM power and supplies it to sub-illumination sources through circuits 64S-LH4 (BU/BK), 64S-LH1 (BU), 64S-LK9 (BU/WH), 64S-LH16 (BU/WH), 64S-LH1 (BU), and the central junction box (CJB) through circuit 64S-AD2 (BU/RD). The CJB separates the PWM power and also supplies it to sub-illumination sources through circuits 64S-LH2 (BU/RD) and 64S-LH33 (BU/BK). The sub-illumination sources then provide the PWM power to the individual illuminating sources.

Possible Causes

- circuit 8-LE10 (WH/BK) open, short to power or ground
- circuit 9-LE10 (BN/YE) open, short to power or ground
- instrument panel dimmer switch
- dimmer module

PINPOINT TEST E: THE INSTRUMENT PANEL ILLUMINATION DOES NOT DIM

Test Step	Result / Action to Take
E1 RETRIEVE DTCS FROM THE INSTRUMENT CLUSTER	
• Use the recorded results from the instrument cluster self-test. • **Are any DTCs retrieved?**	**Yes** If DTC B1246, GO to E3 . If DTC B1342, GO to E6 . **No** GO to E2 .
E2 CHECK THE INSTRUMENT PANEL DIMMER SWITCH MONITOR THE INSTRUMENT CLUSTER PID	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster PID • Turn the headlamps on. • Select and monitor the instrument cluster PID DSWSTAT while rotating the instrument panel dimmer switch from the lowest position to the highest position. • **Does the PID value agree with the instrument panel dimmer switch position?**	**Yes** GO to E7 . **No** GO to E3 .
E3 CHECK CIRCUIT 8-LE10 (WH/BK) FOR AN OPEN OR A SHORT TO GROUND	

• Key in OFF position. • Turn the headlamps off. • Disconnect: Instrument Panel Dimmer Switch C206. • Disconnect: Instrument Cluster C220c. • Measure the resistance between the instrument cluster C220c-16, circuit 8-LE10 (WH/BK), harness side and the instrument panel dimmer switch C206-6, circuit 8-LE10 (WH/BK), harness side and; and between the instrument cluster C220c-16, circuit 8-LE10 (WH/BK), harness side and ground.  A0059737 • **Is the resistance less than 5 ohms between the instrument cluster and the instrument panel dimmer switch; and greater than 10,000 ohms between the instrument cluster and ground?**	**Yes** GO to E4 . **No** REPAIR the circuit. TEST the system for normal operation.
E4 CHECK CIRCUIT 9-LE10 (BN/YE) FOR AN OPEN OR SHORT TO GROUND	
• Measure the resistance between the instrument panel dimmer switch C206-4, circuit 9-LE10 (BN/YE), harness side and the instrument cluster C220c-4, circuit 9-LE10 (BN/YE), harness side; and between the instrument panel dimmer switch C206-4, circuit 9-LE10 (BN/YE), harness side and ground.  A0040362 • **Is the resistance less than 5 ohms between the instrument panel dimmer switch and instrument cluster; and greater than 10,000 ohms between the instrument panel dimmer switch and ground?**	**Yes** GO to E5 . **No** REPAIR the circuit. TEST the system for normal operation.
E5 CHECK CIRCUITS 8-LE10 (WH/BK) AND 9-LE10 (BN/YE) FOR A SHORT TO POWER	
• Key in ON position. • Measure the voltage between the instrument panel dimmer switch C206-6, circuit 8-LE10 (WH/BK), harness side and ground; and between the instrument panel dimmer switch C206-4, circuit 9-LE10 (BN/YE), harness side and ground.	**Yes** REPAIR the circuit(s) in question. TEST the system for normal operation. **No** GO to E6 .

 • **Is any voltage indicated?**	
E6 CHECK THE INSTRUMENT PANEL DIMMER SWITCH	
• Key in OFF position. • Measure the resistance between the instrument panel dimmer switch C206-4, circuit 9-LE10 (BN/YE), component side and the instrument panel dimmer switch C206-6, circuit 8-LE10 (WH/BK), component side.  • Rotate the instrument panel dimmer switch from the minimum brightness level to the maximum brightness level. • **Does the resistance begin at approximately 1k ohm at the minimum brightness level and move to approximately 10,000k ohms at the maximum brightness level?**	**Yes** GO to E8 . **No** INSTALL a new instrument panel dimmer switch. REFER to Instrument Cluster and Panel Illumination in this section. TEST the system for normal operation.
E7 CHECK FOR CORRECT FEM OPERATION	

• Disconnect all the FEM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the FEM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FEM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

E8 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been

	caused by a loose or corroded connector. CLEAR the DTC's. REPEAT the self-test.

Parameter Reset and Key Programming

NOTE: The instrument cluster parameters must be reset upon installation of a new instrument cluster.

NOTE: Both passive anti-theft system (PATS) keys are needed to carry out this procedure.

To reset the instrument cluster parameters and program the keys, complete the following procedure:

1. Connect the diagnostic tool.
2. Select the instrument cluster.
3. Select ENTER SECURITY ACCESS. Wait 10 minutes for security access to be granted.
4. Select PARAMETER RESET.
5. Disconnect the diagnostic tool.
6. Place the first PATS key in the OFF position.
7. Place the key in the ON position.
8. Remove the key.
9. Place the second PATS key in the ON position.
10. Place the key in the OFF position (the programming sequence is complete).

NOTE: If the vehicle fails to start following completion of the parameter reset and key programming sequence, clear the keep alive memory (KAM) by disconnecting the battery for five minutes. For additional information about the battery disconnect procedure, refer to Section 414-00 .

Inspection and Verification

NOTE: Upon installation, the instrument cluster, REM or FEM must be reconfigured. Refer to Section 418-00 .

NOTE: For any concerns with the restraint control module (RCM), refer to Section 501-20B .

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical and electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Washer fluid level • Fuel tank • Engine coolant level • Accessory drive belt • Engine oil level • Brake fluid level	• Central junction box (CJB) fuse(s): ♦ 4 (5A) ♦ 5 (10A) ♦ 7 (5A) ♦ 13 (5A) ♦ 17 (5A) ♦ 20 (10A) • Battery junction box (BJB) fuse(s): ♦ 15 (40A) ♦ 22 (20A) ♦ 25 (40A) • Circuitry • Connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, connect the diagnostic tool to the data link connector and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
   - check that the program card is correctly installed.
   - check the connections to the vehicle.
   - check the ignition switch position.

5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

6. Carry out the diagnostic tool data link test. If the diagnostic tool responds with:
   - SCP+ or SCP- circuit fault; all electronic control units no response/not equipped, refer to Section 418-00 .
   - No response/not equipped for the instrument cluster, Go To Pinpoint Test F .
   - No response/not equipped for the electronic parking brake module, Section 206-00 .
   - No response/not equipped for the FEM, REFER to Section 418-00 .

- No response/not equipped for the REM, REFER to Section 418-00 .
- No response/not equipped for the RCM, REFER to Section 501-20B .
- No response/not equipped for the PCM, REFER to Section 418-00 .
- System passed, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out the self-test diagnostics for the instrument cluster.

7. If the DTCs retrieved are related to the concern, go to the Instrument Cluster Diagnostic Trouble Code (DTC) Index, Front Electronic Module (FEM) Diagnostic Trouble Code (DTC) Index, Rear Electronic Module (REM) Diagnostic Trouble Code (DTC) Index, Restraint Control Module (RCM) Diagnostic Trouble Code (DTC) Index, or the Powertrain Control Module (PCM) Diagnostic Trouble Code (DTC) Index to continue diagnostics. For the electronic brake control module DTCs, refer to Section 206-00 . For all other DTCs, refer to Section 418-00 .

8. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Instrument Cluster Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1202	Fuel Sender Circuit Open	Instrument Cluster	Go To Pinpoint Test G .
B1204	Fuel Sender Circuit Short to Ground	Instrument Cluster	Go To Pinpoint Test G .
B1205	EIC Switch-1 Assembly Circuit Failure	Instrument Cluster	INSTALL a new instrument cluster; REFER to Instrument Cluster in this section. TEST the system for normal operation.
B1209	EIC Switch-2 Assembly Circuit Failure	Instrument Cluster	INSTALL a new instrument cluster; REFER to Instrument Cluster in this section. TEST the system for normal operation.
B1317	Battery Voltage High	Instrument Cluster	Go To Pinpoint Test P .
B1318	Battery Voltage Low	Instrument Cluster	Go To Pinpoint Test P .
B1342	ECU Is Defective	Instrument Cluster	CLEAR and DOCUMENT the DTCs. CARRY OUT the instrument cluster self-test. INSTALL a new instrument cluster if DTC B1342 is retrieved again. REFER to Instrument Cluster in this section.
B1567	Lamp Headlamp High-Beam Circuit Failure	Instrument Cluster	Go To Pinpoint Test R .
B2143	NVM Memory Failure	Instrument Cluster	Go To Pinpoint Test AE .
B2627	Fuel Sender Circuit Open #2	Instrument Cluster	Go To Pinpoint Test G .
B2628	Fuel Sender Circuit Short to Ground #2	Instrument Cluster	Go To Pinpoint Test G .
B2879	Fuel Tank Jet Pump Fault	Instrument Cluster	Go To Pinpoint Test G .
U1041	SCP (J1850) Invalid or Missing Data for Vehicle	ABS/TC/IVD	CARRY OUT the ABS/TC/IVD self-test.

	Speed		
U1073	SCP (J1850) Invalid or Missing Data for Engine Coolant Fluid Temperature	PCM	CARRY OUT the PCM self-test.
U1123	SCP (J1850) Invalid or Missing Data for Odometer Rolling Count	ABS/TC/IVD	CARRY OUT the ABS/TC/IVD self-test.

Front Electronic Module (FEM) Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1479	Wiper Washer Fluid Level Sensor Circuit Failure	FEM	Go To Pinpoint Test S .
C1284	Engine Oil Pressure Switch Failure	FEM	Go To Pinpoint Test O .

Rear Electronic Module (REM) Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1201	Fuel Sender Circuit Failure	REM	Go To Pinpoint Test G .

For a complete list of instrument cluster, FEM, and REM DTCs, refer to Section 418-00 .

Restraint Control Module (RCM) Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1869	Lamp Air Bag Warning Indicator Circuit Open	RCM	Go To Pinpoint Test AB .
B1870	Lamp Air Bag Warning Indicator Circuit Short to Battery	RCM	Go To Pinpoint Test AB .

For a complete list of RCM DTCs, refer to Section 501-20B .

Powertrain Control Module (PCM) Diagnostic Trouble Code (DTC) Index

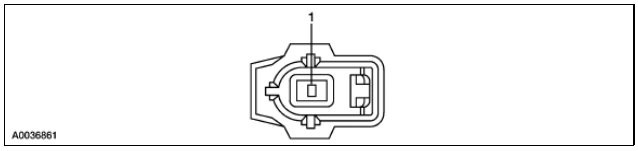
DTC	Description	Source	Action
P0457	Fuel Fill Cap Off	PCM	Go To Pinpoint Test AC .

For a complete list of PCM DTCs, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Symptom Chart

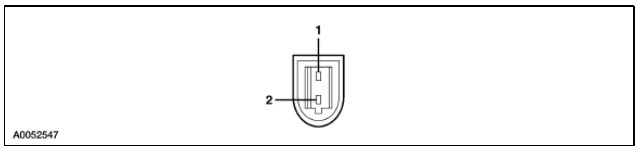
Symptom Chart
Connector Circuit Reference

Engine Oil Pressure Switch C103



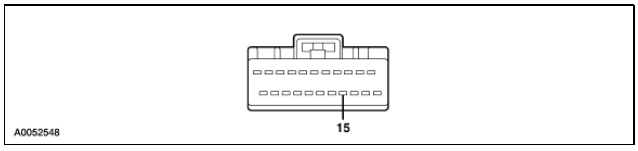
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	Circuit 8-GC21 (WH/GN) oil pressure signal circuit	0 voltage, less than 5 ohms resistance between the front electronic module (FEM) and the engine oil pressure switch. Greater than 10,000 ohms resistance between the instrument cluster and ground.

Low Washer Fluid Switch C138



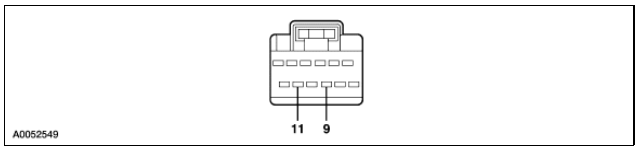
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	Circuit 31-GC8 (BK/OG) low washer fluid switch ground	0 voltage, less than 5 ohms resistance between the low washer fluid switch and ground.
2	Circuit 8-GC8 (WH/BU) low washer fluid signal circuit	0 voltage, less than 5 ohms resistance between the low washer fluid switch and the front electronic module (FEM). Greater than 10,000 ohms resistance between the low washer fluid switch and ground.

Front Electronic Module (FEM) C201b



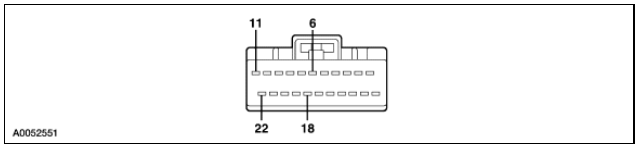
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
15	Circuit 8-GC8 (WH/BU) low washer fluid signal circuit	0 voltage, less than 5 ohms resistance between the FEM and the low washer fluid switch. Greater than 10,000 ohms resistance between the FEM and ground.

Front Electronic Module (FEM) C201c



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
9	Circuit 8-GC21 (WH/GN) oil pressure signal circuit	0 voltage, less than 5 ohms resistance between the FEM and the engine oil pressure switch. Greater than 10,000 ohms resistance between the FEM and ground.
11	Circuit 8-GC7 (WH/RD) brake fluid level signal circuit	0 voltage, less than 5 ohms resistance between the FEM and the brake fluid level switch. Greater than 10,000 ohms resistance between the FEM and ground.

Instrument Cluster C220a



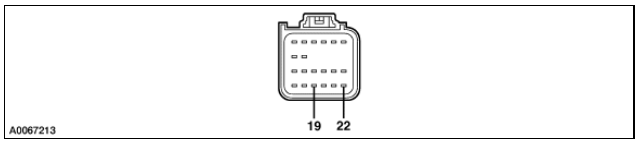
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
6	Circuit 31-AL11 (BK) cluster ground	0 voltage, 5 ohms resistance or less between the instrument cluster and ground.
11	Circuit 15-JA14 (GN/BK) B+ power feed, hot in the START/RUN position	Greater than 10 volts in the START/RUN position. Less than 5 ohms resistance between the instrument cluster and the ignition switch and greater than 10,000 ohms resistance between the instrument cluster and ground.
18	Circuit 8-GE52 (WH/BK) safety belt warning indicator control circuit	0 voltage, 5 ohms resistance or less between the instrument cluster and the restraint control module (RCM). Greater than 10,000 ohms resistance between the instrument cluster and ground.
22	Circuit 31S-JA14 (BK/GN) air bag warning indicator control circuit	0 voltage, 5 ohms resistance or less between the instrument cluster and the RCM. Greater than 10,000 ohms resistance between the instrument cluster and ground.

Instrument Cluster C220b

	Circuit Designation/Description	Normal Condition/Measurement

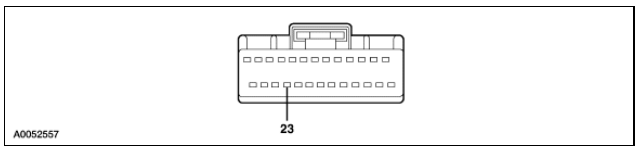
Pin Number(s)		
3	Circuit 29-GG11 (OG/BU) B+ keep alive memory power	Greater than 10 volts at all times. Less than 5 ohms resistance between the instrument cluster and the and battery junction box (BJB) and greater than 10,000 ohms resistance between the instrument cluster and ground.
6	Circuit 15-GG14 (GN/RD) B+ power feed, hot in the START/RUN position	Greater than 10 volts with the key in the START/RUN position. Less than 5 ohms resistance between the instrument cluster and the ignition switch and greater than 10,000 ohms resistance between the instrument cluster and ground.
13	Circuit 91-GG11 (BK/BU) instrument cluster logic ground.	0 voltage, 5 ohms resistance or less between the instrument cluster and ground.
17	Circuit 75-GG15 (YE/GN) B+ power feed, hot in the RUN/ACC position	Greater than 10 volts with the key in the RUN/ACC position. Less than 5 ohms resistance between the instrument cluster and the ignition switch and greater than 10,000 ohms resistance between the instrument cluster and ground.

Restraint Control Module (RCM) C310a



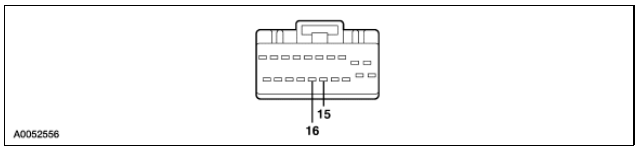
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
19	Circuit 31S-JA14 (BK/GN) air bag warning indicator control circuit	0 voltage, 5 ohms resistance or less between the instrument cluster and the RCM. Greater than 10,000 ohms resistance between the instrument cluster and ground.
22	Circuit 8-GE52 (WH/BK) safety belt warning indicator control circuit	0 voltage, 5 ohms resistance or less between the instrument cluster and the restraint control module (RCM). Greater than 10,000 resistance ohms between the instrument cluster and ground.

Rear Electronic Module C420c



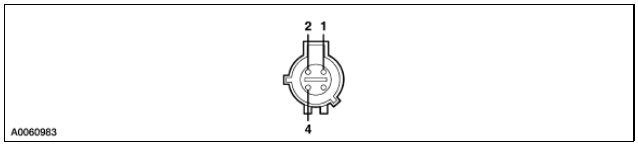
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
23	Circuit 9-GA1 (BN) fuel level signal return	0 voltage, 5 ohms resistance or less between the REM and the fuel delivery module and jet pump module. Greater than 10,000 ohms resistance between the REM and ground.

Rear Electronic Module (REM) C420d



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
15	Circuit 8-GA7 (WH/RD) fuel level variable input signal from the fuel delivery module	0 voltage, less than 5 ohms resistance between the REM and the fuel delivery module. Greater than 10,000 ohms resistance between the REM and ground.
16	Circuit 8-GA25 (WH/BU) fuel level variable input signal from the jet pump module	0 voltage, less than 5 ohms resistance between the REM and the jet pump module. Greater than 10,000 ohms resistance between the REM and ground.

Fuel Delivery Module C433



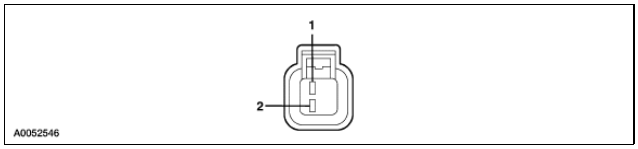
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	Circuit 15S-RG2A (BK/RD) fuel pump return circuit	0 voltage, less than 5 ohms resistance between the fuel delivery module and the REM. Greater than 10,000 ohms resistance between the fuel delivery module and ground.
2	Circuit 8-GA7 (WH/RD) fuel level variable input signal from the fuel delivery module	0 voltage, less than 5 ohms resistance between the fuel delivery module and the REM. Greater than 10,000 ohms resistance between the fuel delivery module and ground.
4	Circuit 9-GA7 (BN/RD) fuel level signal return	0 voltage, 5 ohms resistance or less between the fuel delivery module and the REM. Greater than 10,000 ohms resistance between the fuel delivery module and ground.

Jet Pump Module C434

	Circuit Designation/Description	Normal Condition/Measurement

Pin Number(s)		
2	Circuit 8-GA25 (WH/BU) fuel level variable input signal from the jet pump module	0 voltage, less than 5 ohms resistance between the jet pump module and the REM. Greater than 10,000 ohms resistance between the jet pump module and ground.
4	Circuit 9-GA25 (BN/BU) fuel level signal return	0 voltage, 5 ohms resistance or less between the jet pump module and the REM. Greater than 10,000 ohms resistance between the jet pump module and ground.

Brake Fluid Level Switch C1395



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	Circuit 8-GC7 (WH/RD) brake fluid level signal circuit	0 voltage, less than 5 ohms resistance between the brake fluid level switch and the front electronic module (FEM). Greater than 10,000 ohms resistance between the brake fluid level switch and ground.
2	Circuit 31-GC7 (BK/BU) brake fluid level ground	0 voltage, less than 5 ohms resistance between the brake fluid level switch and ground.

Pinpoint Test F: No Communication With The Instrument Cluster Module

Normal Operation

The instrument cluster communicates interactively with other electronic modules using the standard corporate protocol (SCP) communication network. Communication is accomplished through the use of an unshielded, twisted pair cable data bus line, circuits 4-EG8 (GY/VT) and 5-EG8 (BU/WH). For additional information on module communication, refer to Section 418-00 . With the key in the START/RUN position, the instrument cluster receives power from the central junction box (CJB) fuse(s) 4 (5A), circuit 15-GG14 (GN/RD) and 17 (5A), circuit 15-JA14 (GN/BK), while in the RUN/ACC position, power is received from the CJB fuse 13 (5A), circuit 75-GG15 (YE/GN). With the key in the OFF position, the instrument cluster receives its keep-alive power from CJB fuse 20 (10A), circuit 29-GG11 (OG/BU). The instrument cluster grounding is accomplished through circuit 91-GG11 (BK/BU).

Possible Causes

- CJB fuse(s): 4 (5A), 13 (5A), 17 (5A) and 20 (10A)
- battery junction box (BJB) fuse 25 (40A)
- circuit 4-EG8 (GY/VT) open, short to power or ground
- circuit 5-EG8 (BU/WH) open, short to power or ground
- circuit 15-GG14 (GN/RD) open or short to ground
- circuit 15-JA14 (GN/BK) open or short to ground
- circuit 29-GG11 (OG/BU) open or short to ground
- circuit 31-AL11 (BK) open
- circuit 75-GG15 (YE/GN) open or short to ground

- circuit 91-GG11 (BK/BU) open
- instrument cluster

PINPOINT TEST F: NO COMMUNICATION WITH THE INSTRUMENT CLUSTER MODULE

Test Step	Result / Action to Take
⚠ **CAUTION: Use the correct probe adaptor(s) when making measurements. Failure to use the correct probe adaptor(s) may damage the connector.**	
F1 CHECK HOT AT ALL TIMES POWER SUPPLY CIRCUIT	
• Key in OFF position. • Disconnect: Instrument Cluster C220b. • Measure the voltage between the instrument cluster C220b-3, circuit 29-GG11 (OG/BU), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to F2 . **No** REPAIR the circuit. TEST the system for normal operation.
F2 CHECK HOT IN RUN POWER SUPPLY CIRCUITS	
• Disconnect: Instrument Cluster C220a. • Key in ON position. • Measure the voltage between the instrument cluster and ground as follows: **Connector Pin / Circuit** C220a-11 — 15-JA14 (GN/BK) C220b-6 — 15-GG14 (GN/RD) C220b-17 — 75-GG15 (YE/GN)  • **Are the voltages greater than 10 volts?**	**Yes** GO to F3 . **No** REPAIR the circuit in question. TEST the system for normal operation.
F3 CHECK THE GROUND CIRCUITS 91-GG11 (BK/BU) AND 31-AL11 (BK) FOR OPEN	

• Key in OFF position. • Measure the resistance between the instrument cluster C220b-13, circuit 91-GG11 (BK/BU), harness side and ground; and between the instrument cluster C220a-6, circuit 31-AL11 (BK), harness side and ground.  • **Are the resistances less than 5 ohms?**	**Yes** REFER to Section 418-00 to continue module communication diagnosis. **No** REPAIR the circuit in question. TEST the system for normal operation.

Pinpoint Test G: Incorrect Fuel Gauge Indication

Normal Operation

Fuel level status is sent to the rear electronic module (REM) from the fuel delivery module through circuit 8-GA7 (WH/RD) and the jet pump module through circuit 9-GA24 (BN/BU). The REM sends the fuel level data to the instrument cluster over the standard corporate protocol (SCP) communication network, circuits 4-EG8 (GY/VT) and 5-EG8 (BU/WH). The instrument cluster provides a signal return (ground) through circuit 9-GA1 (BN), which is spliced to the fuel delivery module return, circuit 9-GA7 (BN/RD) and the jet pump module return, circuit 9-GA7 (BN/RD). Normal operating range of the fuel delivery module sender is from 16 ± 2 ohms at empty (E) to 155 ± 4 ohms at full (F). Normal operating range of the jet pump module is from 19 ± 2 ohms at empty (E) to 160 ± 2 ohms at full (F). Instrument cluster DTC B1202 will set if 8-GA7 (WH/GN) is open or shorted to battery. Instrument cluster DTC B1204 will set if circuit 8-GA7 (WH/GN) is shorted to ground. Instrument cluster DTC B2627 will set if circuit 8-GA25 (WH/BU) is open. Instrument cluster DTC B2628 will set if circuit 8-GA25 (WH/BU) is shorted to ground. REM DTC B1201 will be logged if either the fuel pump delivery or jet pump module are out of range or if the data reading is invalid. If the jet pump module is open, the fuel gauge will default to the fuel pump delivery module value only and the fuel gauge will indicate E to 1/2 tank (depending on the fuel level on the fuel pump delivery module side of the tank). If the fuel delivery module is open, the fuel gauge will default to the empty position. Instrument cluster DTC B2879 will set if the fuel level measured by the jet pump module is greater than the fuel level measured by the fuel delivery module.

Possible Causes

- circuit 8-GA7 (WH/RD) open, short to ground or power
- circuit 8-GA25 (WH/BU) open, short to ground or power
- circuit 9-GA1 (BN) open, short to ground or power
- circuit 9-GA7 (BN/RD) open
- circuit 9-GA25 (BN/BU) open
- fuel delivery module
- jet pump module
- REM
- instrument cluster

PINPOINT TEST G: INCORRECT FUEL GAUGE INDICATION

Test Step	Result / Action to Take
⚠ **CAUTION: Use the correct probe adaptor(s) when making measurements. Failure to use the**	

correct probe adaptor(s) may damage the connector.	
G1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TESTS REAR ELECTRONIC MODULE (REM) AND INSTRUMENT CLUSTER	
NOTE: The fuel gauge does not change indication unless there has been at least eleven liters (three gallons) of fuel added or removed between one ignition switch cycle (ON, OFF and ON). • Use the recorded instrument cluster and rear electronic module (REM) DTCs from the continuous and on-demand self-test. • **Are any DTCs recorded?**	**Yes** If instrument cluster DTC B1202, B1204, B2627 or B2628 or if REM DTC B1201 is retrieved, GO to G7 . If instrument cluster DTC B2879 is retrieved, GO to G3 . For all other instrument cluster and REM DTCs, REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Index or the REM Diagnostic Trouble Code (DTC) Index. **No** GO to G2 .
G2 CARRY OUT THE INSTRUMENT CLUSTER FUEL GAUGE ACTIVE COMMAND	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster FUEL GAUGE CONTROL active command. • Trigger FUELLEVEL active command. Toggle and monitor the fuel gauge while adjusting the FUELLEVEL active command to read 50% and 100%. • **Did the fuel gauge needle start at empty (E), move to half at 50%, and full (F) at 100%?**	**Yes** GO to G3 . **No** GO to G13 .
G3 CHECK THE FUEL DELIVERY MODULE RESISTANCE READING	
NOTE: The fuel delivery module sender resistance varies from 16 ± 2 ohms when empty (E) to 155 ± 4 ohms when full (F). • Key in OFF position. • Disconnect: Fuel Delivery Module C433. • Measure the resistance between the fuel delivery module C433-2, circuit 8-GA7 (WH/RD), component side and the fuel delivery module C433-4, circuit 9-GA7 (BN/RD), component side.	**Yes** GO to G4 . **No** GO to G5 .

 A0060985 • **Is the resistance within specifications?**	
G4 CHECK THE JET PUMP MODULE RESISTANCE READING	
NOTE: The jet pump module sender resistance varies from 19 ± 2 ohms when empty (E) to 160 ± 4 ohms when full (F). • Key in OFF position. • Disconnect: Jet Pump Module C434. • Measure the resistance between the jet pump module C434-2, circuit 8-GA25 (WH/BU), component side and the jet pump module C434-4, circuit 9-GA25 (BN/BU), component side.  A0060985 • **Is the resistance within specifications?**	**Yes** GO to G5 . **No** GO to G6 .
G5 INSPECT THE FUEL TANK	
• Visually inspect the fuel tank for any damage or deformation. • **Is the fuel tank OK?**	**Yes** GO to G6 . **No** INSTALL a new fuel tank. REFER to Section 310-00 . TEST the system for normal operation.
G6 INSPECT THE FUEL LEVEL SENSOR AND PUMP ASSEMBLY	
• Visually inspect the float and float rod for damage or obstruction. • **Are the fuel pump and wiring OK?**	**Yes** INSTALL a new fuel level sender. REFER to Section 310-00 . TEST the system for normal operation. **No** REPAIR as necessary. REFER to Section 310-00 . TEST the system for normal operation.
G7 CHECK CIRCUIT 8-GA7 (WH/RD), CIRCUIT 8-GA25 (WH/BU) AND CIRCUIT 9-GA1 (BN) FOR SHORT TO GROUND WITH THE REAR ELECTRONIC MODULE (REM) DISCONNECTED	

• Disconnect: Rear Electronic Module (REM) C420e. • Disconnect: REM C420d. • Measure the resistance between the REM C420d-15, circuit 8-GA7 (WH/RD), harness side and ground; and between the REM C420d-16, circuit 8-GA25 (WH/BU), harness side and ground.  A0004796 • Measure the resistance between the REM C420c-23, circuit 9-GA1 (BN), harness side and ground.  A0004797 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to G9 . **No** GO to G8 .
G8 CHECK CIRCUIT 8-GA7 (WH/RD), CIRCUIT 8-GA25 (WH/BU) AND CIRCUIT 9-GA1 (BN) FOR SHORT TO GROUND WITH FUEL PUMP MOTOR AND FUEL SENDER DISCONNECTED	
• Disconnect: (RH) Fuel Delivery Module C433. • Disconnect: (LH) Jet Pump Module C434. • Measure the resistance between the REM C420d-15, circuit 8-GA7 (WH/RD), harness side and ground; and between the REM C420d-16, circuit 8-GA25 (WH/BU), harness side and ground.  A0004796 • Measure the resistance between the REM C420c-23, circuit 9-GA1 (BN), harness side and ground.  A0004797 • **Are the resistances greater than 10,000 ohms?**	**Yes** REPAIR the fuel sender circuit in question. TEST the system for normal operation. **No** REPAIR the circuit in question. TEST the system for normal operation.
G9 CHECK CIRCUIT 8-GA7 (WH/RD), CIRCUIT 8-GA25 (WH/BU) AND CIRCUIT 9-GA1 (BN) FOR SHORT TO BATTERY	

• Disconnect: REM C420c. • Disconnect: REM C420d. • Key in ON position. • Measure the voltage between the REM C420d-15, circuit 8-GA7 (WH/RD), harness side and ground; and between the REM C420d-16, circuit 8-GA25 (WH/BU), harness side and ground.  A0004803 • Measure the voltage between the REM C420c-23, circuit 9-GA1 (BN), harness side and ground  A0004804 • **Is any voltage indicated?**	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to G10 .
G10 CHECK CIRCUIT 8-GA7 (WH/RD), CIRCUIT 9-GA1 (BN) AND CIRCUIT 9-GA7 (BN/RD) FOR OPEN	
• Key in OFF position. • Disconnect: (RH) Fuel Delivery Module C433. • Disconnect: (LH) Jet Pump Module C434. • Measure the resistance between the REM C420d-15, circuit 8-GA7 (WH/RD), harness side and the fuel delivery module C433-2, circuit 8-GA7 (WH/RD), harness side.  A0004800 • Measure the resistance between the REM C420d-16, circuit 8-GA25 (WH/BU), harness side and the jet pump module C434-2, circuit 8-GA25 (WH/BU), harness side.  A0004801 • Measure the resistance between the REM C420c-23, circuit 9-GA1 (BN), harness side and the fuel delivery module C433-4, circuit 9-GA7 (BN/RD), harness side.	**Yes** GO to G11 . **No** REPAIR the circuit in question. TEST the system for normal operation.

 A0004802 • Measure the resistance between the REM C420c-23, circuit 9-GA1 (BN), harness side and the jet pump module C434-4, circuit 9-GA25 (BN/BU), harness side.  A0004802 • **Are the resistances less than 5 ohms?**	
G11 CHECK FUEL PUMP MODULE FOR SHORT	
• Measure the resistance between the fuel delivery module C433-1, circuit 15S-RG2A (GN/BU), component side and the fuel delivery module C433-2, circuit 8-GA7 (WH/RD), component side; and between the fuel delivery module C433-1, circuit 15S-RG2A (GN/BU), component side and the fuel delivery module C433-4, circuit 9-GA7 (BN/RD), component side.  A0060986 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to G12 . **No** REPAIR in-tank fuel pump module, and fuel sender circuit(s) as necessary. REFER to Section 310-00 . TEST the system for normal operation.
G12 CHECK FOR CORRECT REM OPERATION	

• Disconnect all the REM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the REM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new REM. REFER to Section 418-00 . CLEAR the DTCs and REPEAT the self-test. If incorrect fuel gauge indication is still present, GO to G13 .
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

G13 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test H: Incorrect Temperature Gauge Indication

Normal Operation

Normal engine operating temperature is 140° F (60° C) to 248° F (120° C). Redline starts at 249.8° F (121° C). The cylinder head temperature (CHT) sensor unit monitors the coolant temperature at the cylinder head and is hardwired directly to the powertrain control module (PCM) through circuit 8-RJ33 (WH/VT) and circuit 9-RJ33 (BN/WH). The status of the engine coolant temperature is sent from the PCM to the instrument cluster over the standard corporate protocol (SCP) communication network, circuits 4-EG8 (GY/VT) and 5-EG8 (BU/WH). The instrument cluster DTC U1073 will be logged if the instrument cluster fails to receive the engine temperature status from the PCM.

Possible Causes

- circuit 8-RJ33 (WH/VT) open, short to power or ground
- circuit 9-RJ33 (BN/WH) open, short to power or ground
- CHT sensor unit
- powertrain control module (PCM)
- instrument cluster

PINPOINT TEST H: INCORRECT TEMPERATURE GAUGE INDICATION

Test Step	Result / Action to Take
H1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TESTS INSTRUMENT CLUSTER	
• Use the recorded instrument cluster DTCs from the continuous and on-demand self-test. • **Are any instrument cluster DTCs recorded?**	**Yes** If instrument cluster DTC U1073 is retrieved, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. All other DTCs, refer to the Instrument Cluster

	Diagnostic Trouble Code (DTC) Index. **No** GO to H2 .
H2 CARRY OUT THE INSTRUMENT CLUSTER ENGINE COOLANT TEMPERATURE GAUGE ACTIVE COMMAND	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster ENGINE COOLANT CONTROL active command. • Trigger the ENGCOOLNT active command. Toggle and monitor the engine coolant temperature gauge while adjusting the ENGCOOLNT active command to read 50% and 100%. • **Did the temperature gauge needle start at cold, move to half at 50%, and full hot at 100%?**	**Yes** GO to H3 . **No** GO to H4 .
H3 CHECK FOR CORRECT PCM OPERATION	

• Disconnect all the PCM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all PCM the connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-04A or Section 303-04B . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. TEST the system for normal operation.

H4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test I: The Low Fuel Warning Indicator Is Never/Always On

Normal Operation

Typically, the low fuel indicator will turn on when the fuel level reaches a predetermined level of approximately 1/8 tank. The low fuel level warning indicator and fuel gauge are controlled by the instrument cluster based upon the fuel level data provided by the rear electronic module (REM). When the instrument cluster receives data from the REM that indicates the fuel level has reached the preset low fuel level, the fuel gauge will indicate low fuel and the instrument cluster will turn on the low fuel warning indicator. A correctly functioning fuel gauge indicates that the fuel pump modules, the circuitry to the REM and the REM are operating correctly.

Possible Causes

- REM
- instrument cluster

PINPOINT TEST I: THE LOW FUEL WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
I1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TESTS INSTRUMENT CLUSTER AND REAR ELECTRONIC MODULE (REM)	
• Use the recorded instrument cluster and rear electronic module (REM) DTCs from the continuous and on-demand self-test. • **Are any DTCs recorded?**	**Yes** If instrument cluster DTC B1202, B1204, B2627 or B2628 or REM DTC B1201 are retrieved, Go To Pinpoint Test G . **No** GO to I2 .
I2 CARRY OUT THE INSTRUMENT CLUSTER WARNING LAMPS AND CHIME ACTIVE COMMAND USING THE DIAGNOSTIC TOOL	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster WARNING LAMPS AND CHIME active command. Trigger ALL LAMPS active command ON and OFF. Observe the low fuel warning indicator. • **Does the low fuel indicator illuminate and turn off?**	**Yes** Go To Pinpoint Test G . **No** GO to I3 .
I3 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this

• Operate the system and verify the concern is still present. • **Is the concern still present?**	time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test J: The Speedometer Is Inoperative

Normal Operation

Vehicle speed information is sent to the anti-lock brake system/traction control/integrated vehicle dynamics (ABS/TC/IVD), ABS/TC or ABS module from each of the four wheel speed sensors. The vehicle speed information is then sent to the instrument cluster by the ABS module over the standard corporate protocol (SCP) communication network, circuits 4-EG8 (GY/VT) and 5-EG8 (BU/WH). Instrument cluster DTC U1041 will be logged if the instrument cluster fails to receive the vehicle speed data from the ABS/T/IVD, ABS/TC or ABS module.

Possible Causes

- ABS/TC/IVD, ABS/TC or ABS module
- instrument cluster

PINPOINT TEST J: THE SPEEDOMETER IS INOPERATIVE

Test Step	Result / Action to Take
J1 CARRY OUT THE INSTRUMENT CLUSTER SPEEDOMETER ACTIVE COMMAND	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster SPEEDOMETER COMMAND active command. • Trigger SPDOMETER and scroll in increments of 10%. Monitor the speedometer gauge. The speedometer should be increasing in increments of 16 mph for every 10%. • **Does the speedometer increase within specification?**	**Yes** GO to J2 . **No** GO to J4 .
J2 CARRY OUT THE INSTRUMENT CLUSTER DIGITAL SEGMENT DISPLAY ACTIVE COMMAND	
• Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster DISPLAY SEGMENT CONTROL II active command. • Trigger the SEGMENTS active command. • **Do all segments illuminate?**	**Yes** GO to J3 **No** GO to J4 .
J3 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND	

SELF-TESTS INSTRUMENT CLUSTER	
• Use the recorded instrument cluster DTCs from the continuous and on-demand self-test. • **Are any DTCs recorded?**	**Yes** If instrument cluster DTC U1041 is recorded, REFER to Section 206-09 to continue diagnosis. All other instrument cluster DTCs, REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Index. **No** GO to J4 .
J4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test K: The Odometer Is Inoperative

Normal Operation

Vehicle odometer information is sent to the instrument cluster from the anti-lock brake system/traction control/integrated vehicle dynamics (ABS/TC/IVD). ABS/TC or ABS module over the standard corporate protocol (SCP) communication network, circuits 4-EG8 (GY/VT) and 5-EG8 (BU/WH). DTC U1123 will be logged if the instrument cluster fails to receive the odometer rolling count status from the ABS/TC/IVD, ABS/TC or ABS module. The instrument cluster DTC B2143 will be logged if the instrument cluster detects a nonvolatile memory (NVM) failure.

Possible Causes

- ABS/TC/IVD, ABS/TC or ABS module
- instrument cluster

PINPOINT TEST K: THE ODOMETER IS INOPERATIVE

Test Step	Result / Action to Take
K1 CHECK THE SPEEDOMETER OPERATION	
• Operate the vehicle to verify that the speedometer operates correctly. • **Does the speedometer operate correctly?**	**Yes** GO to K2 . **No** Go To Pinpoint Test J .

K2 CARRY OUT THE INSTRUMENT CLUSTER DIGITAL SEGMENT DISPLAY ACTIVE COMMAND	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster DISPLAY SEGMENT CONTROL II active command. • Trigger the SEGMENTS active command. • **Do all segments illuminate?**	**Yes** GO to K3 . **No** GO to K4 .
K3 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TESTS INSTRUMENT CLUSTER	
• Use the recorded instrument cluster DTCs from the continuous and on-demand self-test. • **Are there any DTCs recorded?**	**Yes** If the instrument cluster DTC U1123 is recorded, REFER to Section 206-09 to continue module communication diagnosis. If DTC B2143 is recorded, GO to K4 . All other instrument cluster DTCs, REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Index. **No** GO to K4 .
K4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test L: The Tachometer Is Inoperative

Normal Operation

Engine speed is monitored by the powertrain control module (PCM) through the crankshaft position sensor. The crankshaft position sensor is hardwired directly to the PCM through circuit 8-RJ4 (WH/RD) and circuit 10-RJ4 (GY/RD). The status of the crankshaft position sensor is sent from the PCM to the instrument cluster over the standard corporate protocol (SCP) communication network, circuits 4-EG8 (GY/VT) and 5-EG8

(BU/WH).

Possible Causes

- PCM
- instrument cluster

PINPOINT TEST L: THE TACHOMETER IS INOPERATIVE

Test Step	Result / Action to Take
L1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TESTS POWERTRAIN CONTROL MODULE (PCM)	
• Use the recorded PCM DTCs from the continuous and on-demand self-test. • **Are any DTCs recorded?**	**Yes** REPAIR the DTC. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to L2 .
L2 CARRY OUT THE INSTRUMENT CLUSTER TACHOMETER ACTIVE COMMAND USING THE DIAGNOSTIC TOOL	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster TACHOMETER CONTROL active command. Trigger the TCHOMETER active command. Adjust the scroll knob until TCHOMETER reads 50%. Note the tachometer gauge reading. • Adjust the scroll knob until TCHOMETER reads 100%. Note the tachometer gauge reading. • **Does the tachometer gauge needle start at 0 rpm, move to approximately 3500 rpm at 50% and 7000 rpm at 100%?**	**Yes** GO to L4 . **No** GO to L3 .
L3 CHECK FOR CORRECT PCM OPERATION	

• Disconnect all the PCM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-04A or Section 303-04B . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. TEST the system for normal operation.

L4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test M: The Door Ajar Indicator Is Inoperative (Chime Is Operative)/Does Not Operate Correctly

Normal Operation

The normally open front door ajar switches are directly hardwired to the front electronic module (FEM) and the normally open rear door ajar switches are hardwired to the rear electronic module (REM). When any door is open, the door ajar switch provides a ground signal to the FEM or REM. When the door is closed, the door ajar switch opens, removing the ground signal to the FEM or REM. The FEM and REM uses the multiple inputs from the door ajar switches to determine whether the doors are in the opened or closed position and provides a signal to the instrument cluster over the standard corporate protocol (SCP) communication network, circuits 4-EG8 (GY/VT) and 5-EG8 (BU/WH). A door ajar chime that is operating correctly indicates that the FEM is monitoring the correct operation of the door ajar switches.

Possible Causes

- FEM
- REM
- instrument cluster

PINPOINT TEST M: THE DOOR AJAR INDICATOR IS INOPERATIVE (CHIME IS OPERATIVE)/DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
M1 CHECK THE INTERIOR DOME LAMP OPERATION	
• Key in ON position. • Open and close each door and monitor the interior dome lamp. • **Does the interior dome lamp operate correctly?**	**Yes** GO to M2 . **No** REPAIR the interior dome lamp. REFER to Section 417-02 .
M2 CARRY OUT THE INSTRUMENT CLUSTER WARNING LAMPS AND CHIME ACTIVE COMMAND	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command.	**Yes** GO to M3 . **No** GO to M4 .

• Select the instrument cluster WARNING LAMPS AND CHIME active command. Trigger the ALL LAMPS active command ON and OFF. Observe the door ajar warning indicator. • **Does the door ajar warning indicator illuminate when triggered ON, and turn off when triggered OFF?**	
M3 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TESTS FRONT ELECTRONIC MODULE (FEM) AND REAR ELECTRONIC MODULE (REM)	
• Use the recorded front electronic module (FEM) and rear electronic module (REM) DTCs from the continuous and on-demand self-test. • **Are any FEM or REM DTCs recorded?**	**Yes** REFER to the FEM Diagnostic Trouble Code (DTC) Index or the REM Diagnostic Trouble Code (DTC) Index. **No** GO to M4 .
M4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test N: The Safety Belt Warning Indicator Is Never/Always On

Normal Operation

The safety belt switch is hardwired directly to the restraint control module (RCM) through circuit 8-JA54 (WH) and grounded through circuit 31-JA54 (BK/YE). The instrument cluster receives the safety belt switch status from the RCM through circuit 8-GE52 (WH/BK). The RCM monitors resistance between the safety belt switch and ground and signals the instrument cluster when the safety belt is unfastened to turn on the safety belt warning indicator.

Possible Causes

- circuit 8-GE52 (WH/BK) open short to ground
- circuit 8-JA54 (WH) open, short to power or ground
- circuit 31-JA54 (BK/YE) open or short to power
- RCM
- instrument cluster

PINPOINT TEST N: THE SAFETY BELT WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
⚠ CAUTION: Use the correct probe adaptor(s) when making measurements. Failure to use the correct probe adaptor(s) may damage the connector.	
N1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TESTS RESTRAINT CONTROL MODULE (RCM)	
• Use the recorded restraint control module (RCM) DTCs from the continuous and on-demand self-test. • **Are any RCM DTCs recorded?**	**Yes** REPAIR the RCM DTC. REFER to Section 501-20B . **No** GO to N2 .
N2 MONITOR THE INSTRUMENT CLUSTER SAFETY BELT PID	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster PID. • Select and monitor the instrument cluster safety belt PID while fastening and unfastening the safety belt. • **Does the PID agree with the safety belt position?**	**Yes** GO to N4 . **No** GO to N3 .
N3 CHECK THE SAFETY BELT SWITCH INPUT CIRCUIT 8-GE52 (WH/BK) FOR OPEN AND SHORT TO GROUND	
• Key in OFF position. • Disconnect: Instrument Cluster C220a. • Disconnect the RCM C310a. REFER to Section 501-20B for disconnect procedure. • Measure the resistance between the instrument cluster C220a-18, circuit 8-GE52 (WH/BK), harness side and the RCM C310a-22, circuit 8-GE52 (WH/BK), harness side; and between the instrument cluster C220a-18, circuit 8-GE52 (WH/BK), harness side and ground.  • **Is the resistance less than 5 ohms between the instrument cluster and the RCM; and greater than 10,000 ohms between the instrument cluster and ground?**	**Yes** REPAIR the safety belt switch. REFER to Section 501-20B . **No** REPAIR the circuit. TEST the system for normal operation.
N4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all the instrument cluster connectors. • Check for: • corrosion	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST

• pushed-out pins • Connect all the instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test O: The Low Oil Pressure Warning Indicator Is Never/Always On

Normal Operation

The engine oil pressure switch is a normally closed switch that is hardwired to the front electronic module (FEM) through circuit 8-GC21 (WH/GN). When the oil pressure is within normal ranges, the engine oil pressure switch opens, removing the ground signal to the front electronic module (FEM). The FEM, upon the removal of the engine oil pressure switch ground, sends a signal to the instrument cluster through the standard corporate protocol (SCP) communication network to turn off the oil pressure warning indicator. When oil pressure is low, the engine oil pressure switch closes, grounding circuit 8-GC21 (WH/GN) to the FEM. The FEM sends a low oil pressure signal to the instrument cluster through the SCP communication network, circuits 4-EG8 (GY/VT) and 5-EG8 (BU/WH), to turn on the oil pressure warning indicator.

Possible Causes

- circuit 8-GC21 (WH/GN) open, short to ground or power
- engine oil pressure switch
- FEM
- instrument cluster

PINPOINT TEST O: THE LOW OIL PRESSURE WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
⚠ **CAUTION: Use the correct probe adaptor(s) when making measurements. Failure to use the correct probe adaptor(s) may damage the connector.**	
O1 CHECK THE INSTRUMENT CLUSTER LOW OIL PRESSURE WARNING INDICATOR ILLUMINATION	
NOTE: Verify that the oil level is at or near the FULL level. • Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster WARNING LAMPS AND CHIME active command. Trigger the ALL LAMPS active command ON and OFF. • Monitor the low oil pressure warning indicator. • **Does the low oil pressure warning indicator illuminate when triggered ON, and go off when triggered OFF?**	**Yes** GO to O2 . **No** GO to O8 .

O2 MONITOR THE FRONT ELECTRONIC MODULE (FEM) LOW OIL PRESSURE PID	
• Key in OFF position. • Disconnect: Engine Oil Pressure Switch C103. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Front Electronic Module (FEM) PID. • Monitor the front electronic module (FEM) oil pressure PID. • Connect a fused (10A) jumper wire between the engine oil pressure switch C103-1, circuit 8-GC21 (WH/GN), harness side and ground.  A0004821 • **Does the FEM PID read ON and OFF alternately?**	**Yes** GO to O3 . **No** If the oil pressure indicator is inoperative, GO to O4 . If the oil pressure indicator is always on, GO to O6 .
O3 CARRY OUT THE ENGINE OIL PRESSURE TEST	
• Carry out the engine oil pressure test. Refer to Section 303-00 . • **Is the engine oil pressure within specification?**	**Yes** INSTALL a new engine oil pressure switch. REFER to Section 303-01A for 3.0L (4V) or Section 303-01B for 3.9L. TEST the system for normal operation. **No** REPAIR the engine oil pressure. REFER to Section 303-00 .
O4 CHECK CIRCUIT 8-GC21 (WH/GN) FOR OPEN	
• Key in OFF position. • Disconnect: FEM 201c. • Measure the resistance between the FEM C201c-9, circuit 8-GC21 (WH/GN), harness side and the engine oil pressure switch C103-1, circuit 8-GC21 (WH/GN), harness side.  A0004822 • **Is the resistance less than 5 ohms?**	**Yes** GO to O5 . **No** REPAIR the circuit. TEST the system for normal operation.
O5 CHECK CIRCUIT 8-GC21 (WH/GN) FOR SHORT TO BATTERY	

• Measure the voltage between the FEM C201c-9, circuit 8-GC21 (WH/GN), harness side and ground.  A0004823 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to O7 .
O6 CHECK CIRCUIT 8-GC21 (GN/WH) FOR SHORT TO GROUND	
• Disconnect: FEM C201c. • Measure the resistance between the FEM C201c-9, circuit 8-GC21 (WH/GN), harness side and ground.  A0004820 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to O7 . **No** REPAIR the circuit. TEST the system for normal operation.
O7 CHECK FOR CORRECT FEM OPERATION	

• Disconnect all the FEM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the FEM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FEM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

O8 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test P: The Charging System Warning Indicator Is Never/Always On

Normal Operation

The charging system is hardwired to the powertrain control module (PCM) through circuit 8-BA25 (WH/RD) and circuit 10-BA25 (GY/RD). The PCM monitors the battery state of charge and provides generator voltage regulator controls, which effectively increase or decrease the generator output to maintain battery charge and to meet electrical demands on the system. The charging system status is then sent from the PCM to the instrument cluster over the standard corporate protocol (SCP) communication network, circuits 4-EG8 (GY/VT) and 5-EG8 (BU/WH). When the generator output is low, the PCM sends a command to the instrument cluster to turn on the charging system warning indicator. Instrument cluster DTC B1317 will be set if the battery voltage is greater than 17.82 volts ± 1.9 volts DC. Instrument cluster DTC B1318 will be set if the battery voltage is less than 9.0 volts ± 1.5 volts DC. For additional information on the charging system, refer to Section 414-00 .

Possible Causes

- generator
- PCM
- instrument cluster

PINPOINT TEST P: THE CHARGING SYSTEM WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
P1 CHECK CHARGING SYSTEM	
• Check the charging system operation. Refer to Section 414-00 . • **Is the charging system operating correctly?**	**Yes** GO to P2 . **No** REPAIR the charging system. REFER to Section 414-00 .
P2 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TESTS INSTRUMENT CLUSTER	
• Use recorded instrument cluster DTCs from the continuous and on-demand self-test. • **Are instrument cluster DTC B1317 or B1318 retrieved?**	**Yes** REFER to Section 414-00 to continue diagnosis. **No** GO to P3 .
P3 CHECK THE CHARGING SYSTEM WARNING INDICATOR	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster WARNING LAMPS AND CHIME active command. Trigger the ALL LAMPS active command ON and OFF.	**Yes** GO to P4 . **No** GO to P5 .

• Observe the charging system warning indicator. • **Does the charge system warning indicator illuminate when triggered ON, and go off when triggered OFF?**	
P4 CHECK FOR CORRECT PCM OPERATION	

• Disconnect all the PCM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-04A or Section 303-04B . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

P5 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test Q: The Brake Warning Indicator Is Never On

Normal Operation

The instrument cluster utilizes brake fluid level, engagement of the parking brake and the base brake system operation to provide inputs for the BRAKE warning indicator. The brake fluid level switch is hardwired to the front electronic module (FEM) through circuit 8-GC7 (WH/RD) and is grounded through circuit 31-GC7 (BK/BU). When the brake fluid level is low, the FEM sends a command to the instrument cluster over the standard corporate protocol (SCP) communication network, circuits 4-EG8 (GY/VT) and 5-EG8 (BU/WH), to turn on the BRAKE warning indicator. The parking brake system is monitored and controlled by the electronic parking brake module. When the parking brake is applied, the electronic parking brake module sends a command to the instrument cluster over the SCP communication network to turn on the BRAKE warning indicator. The ABS module monitors the brake pressures within the base brake system and provides a message to the instrument cluster over the SCP communication network when a concern exists.

Possible Causes

- circuit 8-GC7 (WH/RD) open or short to ground
- circuit 31-GC7 (BK/BU) open
- circuit 31S-RP9 (BK/GN) open or short to ground
- parking brake switch
- brake fluid level switch
- ABS/TC/IVD, ABS/TC, or ABS module

- FEM
- electronic parking brake module
- instrument cluster

PINPOINT TEST Q: THE BRAKE WARNING INDICATOR IS NEVER ON

Test Step	Result / Action to Take
⚠ CAUTION: Use the correct probe adaptor(s) when making measurements. Failure to use the correct probe adaptor(s) may damage the connector.	
Q1 CHECK THE INSTRUMENT CLUSTER BRAKE WARNING INDICATOR ILLUMINATION	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select instrument cluster warning lamps and chime and trigger ON the ALL LAMPS command. • Observe the BRAKE warning indicator. • **Does the BRAKE warning indicator illuminate when triggered ON?**	**Yes** GO to Q2 . **No** GO to Q8 .
Q2 CHECK THE BRAKE FLUID LEVEL SWITCH OPERATION	
• Disconnect: Brake Fluid Level Switch C1395. • **Does the BRAKE warning indicator illuminate?**	**Yes** GO to Q5 . **No** GO to Q3 .
Q3 CHECK THE BRAKE FLUID LEVEL FRONT ELECTRONIC MODULE (FEM) PID	
• Enter the following diagnostic mode on the diagnostic tool: Front Electronic Module (FEM) PID. • Select and monitor the front electronic module (FEM) brake fluid level PID. • Connect a fused (10A) jumper wire between the brake fluid warning switch C1395-1, circuit 8-GC7 (WH/RD), harness side and the brake fluid warning switch C1395-2, circuit 31-GC7 (BK/BU), harness side. A0060988 • **Does the PID read OFF when the jumper wire is not connected and ON when the jumper wire is connected?**	**Yes** GO to Q8 . **No** GO to Q4 .
Q4 CHECK BRAKE WARNING INDICATOR INPUT CIRCUIT 8-GC7 (WH/RD) FOR SHORT TO GROUND	

• Key in OFF position. • Disconnect: FEM C201c. • Measure the resistance between the FEM C201c-11, circuit 8-GC7 (WH/RD), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to Q7 . **No** REPAIR the circuit. TEST the system for normal operation.
Q5 CHECK THE ELECTRONIC PARKING BRAKE SYSTEM OPERATION	
• Operate the electronic parking brake system and verify the system operates correctly. • **Does the electronic parking brake system operate correctly?**	**Yes** GO to Q6 . **No** REPAIR the electronic parking brake system. REFER to Section 206-00 .
Q6 CHECK THE ELECTRONIC PARKING BRAKE MODULE PARKING BRAKE SWITCH INPUT	
• Enter the following diagnostic mode on the diagnostic tool: Electronic Parking Brake Module PID. • Select and monitor the electronic parking brake module apply switch active, and release switch active, PIDs while switching the electronic parking brake ON then OFF. • **Do the apply switch active and release switch active PIDs agree with the switch position?**	**Yes** GO to Q8 . **No** GO to Q9 .
Q7 CHECK FOR CORRECT FEM OPERATION	

• Disconnect all the FEM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the FEM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FEM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Q8 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No

• Operate the system and verify the concern is still present. • **Is the concern still present?**	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
Q9 CHECK FOR CORRECT ELECTRONIC PARKING BRAKE MODULE OPERATION	

• Disconnect all the electronic parking brake module connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the electronic parking brake module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new electronic parking brake module. REFER to Section 206-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test R: The High Beam Indicator Is Never/Always On

Normal Operation

The instrument cluster uses both headlamp switch position and multifunction switch position inputs to control the high beam indicator. The headlamp switch signal is transmitted to the instrument cluster from the headlamp switch through signal circuit 8-LE21 (WH/GN) and return circuit 9-LE29 (BN/GN). Once the instrument cluster sees the headlamp ON signal, the cluster monitors resistance through the multifunction switch to determine whether the switch is in the high beam or low beam position. The multifunction switch is hardwired to the instrument cluster through signal circuit 8-LE14 (WH/BU) and return circuit 9-LG43 (BN/WH). Instrument cluster DTC B1567 will set if circuit 8-LE14 (WH/BU) is open or shorted.

Possible Causes

- circuit 8-LE14 (WH/BU) open, short to ground or short to power
- circuit 9-LG43 (BN/WH) open, short to ground or short to power
- multifunction switch
- instrument cluster

PINPOINT TEST R: THE HIGH BEAM INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
R1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TESTS INSTRUMENT CLUSTER	
• Use the recorded instrument cluster DTCs from the continuous and on-demand self-test. • **Are any instrument cluster DTCs recorded?**	**Yes** If DTC B1567, REPAIR the high beams. REFER to Section 417-01 . All other DTCs, REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Index. **No**

	GO to R2 .
R2 MONITOR THE INSTRUMENT CLUSTER PID LSWMODE	
• Connect the diagnostic tool. • Key in ON position. • Place headlamp switch in the ON position. • Verify that the multifunction switch is in the high beam position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster PID. • Select and monitor the instrument cluster PID HIBEAM with the multifunction switch in the high beam position. • **Does the PID read HIGH?**	**Yes** GO to R3 . **No** REPAIR the high beams. REFER to Section 417-01 .
R3 CARRY OUT THE INSTRUMENT CLUSTER WARNING LAMPS AND CHIME ACTIVE COMMAND	
• Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster WARNING LAMPS AND CHIME active command. Trigger the ALL LAMPS active command ON and OFF. • Observe the high beam indicator. • **Does the high beam indicator illuminate when triggered ON, and turn off when triggered OFF?**	**Yes** REPAIR the high beams. REFER to Section 417-01 . **No** GO to R4 .
R4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test S: The Low Washer Fluid Indicator Is Never/Always On

Normal Operation

The low washer fluid switch is hardwired to the front electronic module (FEM) through circuit 8-GC8 (WH/BU) and grounded through circuit 31-GC8 (BK/OG). The FEM monitors the washer fluid level and sends the low washer fluid data to the instrument cluster over the standard corporate protocol (SCP) communication network, circuits 4-EG8 (GY/VT) and 5-EG8 (BU/WH).

Possible Causes

- circuit 8-GC8 (WH/BU) open, short to ground or power

- circuit 31-GC8 (BK/OG) open
- low washer fluid switch
- FEM
- instrument cluster

PINPOINT TEST S: THE LOW WASHER FLUID INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
⚠ CAUTION: Use the correct probe adaptor(s) when making measurements. Failure to use the correct probe adaptor(s) may damage the connector.	
S1 CHECK THE LOW WASHER FLUID WARNING INDICATOR	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster WARNING LAMPS AND CHIME active command. Trigger the ALL LAMPS active command ON and OFF. • **Does the low washer fluid warning indicator illuminate when triggered ON, and go off when triggered OFF?**	**Yes** GO to S2 . **No** GO to S7 .
S2 MONITOR THE FRONT ELECTRONIC MODULE (FEM) WASHER FLUID LEVEL PID	
• Key in OFF position. • Disconnect: Washer Fluid Level Switch C138. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Front Electronic Module (FEM) PID. • Monitor the front electronic module (FEM) PID WFLUID. • Key in OFF position. • Connect a fused (10A) jumper wire between washer fluid level switch C138-2, circuit 8-GC8 (WH/BU), harness side and ground.  A0004841 • Key in ON position. • Monitor the front electronic module (FEM) PID WFLUID.	**Yes** GO to S3 . **No** REMOVE the jumper wire, EXIT the FEM PID, GO to S4 . If the fused jumper wire blows, REMOVE the jumper and GO to S5 .

• **Does the FEM PID read ON and OFF alternately?**	
S3 CHECK THE WASHER FLUID LEVEL SWITCH GROUND CIRCUIT 31-GC8 (BK/OG) FOR OPEN	
• Key in OFF position. • Measure the resistance between the washer fluid level switch C138-1, circuit 31-GC8 (BK/OG), harness side and ground.  A0004810 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new washer fluid level switch. REFER to Section 501-00 . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
S4 CHECK CIRCUIT 8-GC8 (WH/BU) FOR SHORT TO GROUND	
• Key in OFF position. • Disconnect: FEM C201b. • Measure the resistance between the washer fluid level switch C138-2, circuit 8-GC8 (WH/BU), harness side and ground.  A0004806 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to S6 . **No** REPAIR the circuit. TEST the system for normal operation.
S5 CHECK THE LOW WASHER FLUID SWITCH CIRCUIT 8-GC8 (WH/BU) FOR SHORT TO BATTERY	
• Key in ON position. • Measure the voltage between the FEM C201b-15, circuit 8-GC8 (WH/BU), harness side and ground.  A0004807 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to S6 .
S6 CHECK FOR CORRECT FEM OPERATION	

• Disconnect all the FEM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the FEM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FEM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

S7 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test T: The Anti-Lock Brake System (ABS) Warning Indicator Is Never On

Normal Operation

The status of the anti-lock brake system/traction control/interactive vehicle dynamics (ABS/TC/IVD), ABS/TC, or ABS system is sent to the instrument cluster over the standard corporate protocol (SCP) communication network, circuits 4-EG8 (GY/VT) and 5-EG8 (BU/WH). The instrument cluster monitors the ABS/TC/IVD, ABS/TC or ABS input and turns on the ABS warning indicator when a concern is present.

Possible Causes

- ABS/TC/IVD, ABS/TC, or ABS module
- instrument cluster

PINPOINT TEST T: THE ANTI-LOCK BRAKE SYSTEM (ABS) WARNING INDICATOR IS NEVER ON

Test Step	Result / Action to Take
T1 CHECK THE ANTI-LOCK BRAKE SYSTEM (ABS) WARNING INDICATOR PROVE-OUT	
• Key in ON position. • Monitor the anti-lock brake system (ABS) warning indicator prove-out. The indicator should prove out for approximately six seconds then turn off. • **Does the ABS warning indicator prove out?**	**Yes** The system is OK. **No** GO to T2 .
T2 CARRY OUT THE INSTRUMENT CLUSTER ANTI-LOCK BRAKE SYSTEM (ABS) WARNING INDICATOR ACTIVE COMMAND USING THE DIAGNOSTIC TOOL	

• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster WARNING LAMPS AND CHIME active command. Trigger the ALL LAMPS active command. Observe the anti-lock brake system (ABS) warning indicator. • **Does the ABS warning indicator illuminate?**	**Yes** GO to T3 . **No** GO to T4 .
T3 CHECK FOR CORRECT ABS MODULE OPERATION	

• Disconnect all the ABS module connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the ABS module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ABS module. REFER to Section 206-09 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

T4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test U: The Traction Control And Advance Traction Control Indicators Are Never/Always On

Normal Operation

The traction control status is monitored by the anti-lock brake system/traction control/integrated vehicle dynamics (ABS/TC/IVD) or ABS/TC module. When the traction control is in active mode, a traction active status message is sent to the instrument cluster from the ABS/TC/IVD or ABS/TC module over the standard corporate protocol (SCP) network, circuits 4-EG8 (GY/VT) and 5-EG8 (BU/WH).

Possible Causes

- ABS/TC/IVD or ABS/TC module
- instrument cluster

PINPOINT TEST U: THE TRACTION CONTROL AND ADVANCE TRACTION CONTROL INDICATORS ARE NEVER/ALWAYS ON

Test Step	Result / Action to Take
U1 CARRY OUT THE INSTRUMENT CLUSTER WARNING LAMPS AND CHIME ACTIVE COMMAND USING THE DIAGNOSTIC TOOL	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster WARNING LAMPS AND CHIME active command. Trigger the ALL LAMPS active command ON and OFF. Observe the traction control and advanced traction control indicators. • **Do both the traction control and advanced traction control indicators illuminate and turn off?**	**Yes** GO to U2 . **No** GO to U3 .
U2 CHECK FOR CORRECT ABS/TC/IVD MODULE OPERATION	

• Disconnect all the ABS/TC/IVD module connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the ABS/TC/IVD module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ABS/TC/IVD module. REFER to Section 206-09 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

U3 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test V: The Electronic Throttle Control Indicator Is Never/Always On

Normal Operation

The instrument cluster receives the electronic throttle control status from the powertrain control module (PCM) over the standard corporate protocol (SCP) communication network, circuits 4-EG8 (GY/VT) and 5-EG8 (BU/WH). When a system concern is detected, the PCM sends the instrument cluster a command

signal to turn the electronic throttle control indicator ON.

Possible Causes

- PCM
- instrument cluster

PINPOINT TEST V: THE ELECTRONIC THROTTLE CONTROL INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
V1 CARRY OUT THE INSTRUMENT CLUSTER WARNING LAMPS AND CHIME ACTIVE COMMAND USING THE DIAGNOSTIC TOOL	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster WARNING LAMPS AND CHIME active command. Trigger the ALL LAMPS active command ON and OFF. • Observe the electronic throttle control indicator. • **Does the electronic throttle control indicator illuminate when triggered ON, then turn off when triggered OFF?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual to continue the diagnosis. **No** GO to V2 .
V2 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test W: The Malfunction Indicator Lamp (MIL) Is Never/Always On

Normal Operation

The powertrain control module (PCM) monitors and controls the powertrain functions. When a PCM concern is detected, the PCM provides a signal to the instrument cluster over the standard corporate protocol (SCP) communication network, circuits 4-EG8 (GY/VT) and 5-EG8 (BU/WH), and the instrument cluster turns on the malfunction indicator lamp (MIL).

Possible Causes

- PCM
- instrument cluster

PINPOINT TEST W: THE MALFUNCTION INDICATOR LAMP (MIL) IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
W1 CHECK THE INSTRUMENT CLUSTER ILLUMINATION	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster WARNING LAMPS AND CHIME active command. Trigger the ALL LAMPS active command ON and OFF. Observe the malfunction indicator lamp (MIL). • **Does the MIL warning indicator illuminate when triggered ON, and turn off when triggered OFF?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual to continue diagnosis. **No** GO to W2 .
W2 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test X: The Turn/Hazard Indicator Is Never/Always On

Normal Operation

The multifunction switch is hardwired to the instrument cluster through input circuit 8-LG43 (WH/VT) and return circuit 9-LG43 (BN/WH). Differing resistance ranges are used internally within the multifunction switch to allow the instrument cluster to determine whether the multifunction switch is in the RH or LH turn position. The instrument cluster monitors the input from the multifunction switch and turns on either the RH or LH turn/hazard indicators depending on switch position. The multifunction switch position status is also sent from the instrument cluster to the front electronic module (FEM) and the rear electronic module (REM) to turn on the exterior lighting.

Possible Causes

- circuit 8-LG43 (WH/VT) open, short to power or ground
- circuit 9-LG43 (BN/WH) open, short to power
- FEM
- instrument cluster

PINPOINT TEST X: THE TURN/HAZARD INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
X1 CHECK THE TURN SIGNAL AND HAZARD LAMPS OPERATION	
• Key in ON position. • Operate the turn signal on the left and right sides. • Operate the hazard lamps. • **Do the turn signals and hazard lamps operate correctly?**	**Yes** GO to X2 . **No** REPAIR the turn signals/hazard lamps. REFER to Section 417-01 .
X2 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test Y: The Steering Wheel Column Lock Warning Indicator Is Never/Always On

Normal Operation

The instrument cluster monitors the key-in-ignition, the ignition status and the steering column lock status. The steering column lock status is sent to the instrument cluster from the input of the steering column lock (SCL) module over the standard corporate protocol (SCP) communication network circuits 4-EG8 (GY/VT) and 5-EG8 (BU/WH). The instrument cluster will turn on the steering wheel column lock indicator when the key is in the RUN position and the steering column is locked.

Possible Causes

- steering column lock module
- instrument cluster

PINPOINT TEST Y: THE STEERING COLUMN LOCK WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
Y1 CARRY OUT THE INSTRUMENT CLUSTER WARNING LAMPS AND CHIME ACTIVE COMMAND	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster WARNING LAMPS AND CHIME active command. Trigger the ALL LAMPS active command ON then OFF again. • **Did the steering column lock indicator turn on and off with the active command?**	**Yes** REPAIR the steering wheel column lock system. REFER to Section 211-00 . **No** GO to Y2 .
Y2 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test Z: The Speed Control Indicator Is Never/Always On

Normal Operation

The instrument cluster receives the speed control status from the powertrain control module (PCM) over the standard corporate protocol (SCP) communication network circuits 4-EG8 (GY/VT) and 5-EG8 (BU/WH). When the speed control is engaged, the PCM provides the instrument cluster with the speed control engaged status message and the instrument cluster illuminates the speed control indicator. For additional information on vehicle speed control, refer to Section 310-03 .

Possible Causes

- PCM
- instrument cluster

PINPOINT TEST Z: THE SPEED CONTROL INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
Z1 VERIFY THAT THE SPEED CONTROL AND SPEEDOMETER OPERATE CORRECTLY	

• Verify that the speed control and the speedometer operate correctly. • **Do the speed control and speedometer operate correctly?**	**Yes** GO to Z2 . **No** If the speed control does not operate correctly, REFER to Section 310-03 . If the speedometer does not operate correctly, Go To Pinpoint Test J .
Z2 CARRY OUT THE INSTRUMENT CLUSTER WARNING LAMPS AND CHIME ACTIVE COMMAND	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster WARNING LAMPS AND CHIME active command. Trigger the ALL LAMPS active command ON and OFF. • Observe the speed control indicator. • **Does the speed control indicator illuminate when triggered ON, and turn off when triggered OFF?**	**Yes** GO to Z3 . **No** GO to Z4 .
Z3 CHECK FOR CORRECT POWERTRAIN CONTROL MODULE (PCM) OPERATION	

• Disconnect all the PCM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-04A for 3.0L (4V) or Section 303-04B for 3.9L.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Z4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test AA: The Engine Over-Temperature Warning Indicator Is Never/Always On

Normal Operation

Engine temperature status is transmitted to the powertrain control module (PCM) from the cylinder head temperature sensor through circuit 8-RJ33 (WH/VT). The PCM transmits an over-temperature status to the instrument cluster over the standard corporate protocol (SCP) communication network, circuits 4-EG8 (GY/VT) and 5-EG8 (BU/WH). When engine temperature, as measured at the cylinder head, reaches 121° C (250° F), the PCM enters the first stage of the fail-safe mode and sends a command message to the instrument cluster to turn on the engine over-temperature warning indicator. Instrument cluster DTC U1073 will be set if the instrument cluster fails to receive the engine temperature status from the PCM.

Possible Causes

- circuit 8-RJ33 (WH/VT) open, short to power or short to ground
- cylinder head temperature sender
- PCM
- instrument cluster

PINPOINT TEST AA: THE ENGINE OVER-TEMPERATURE WARNING INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
AA1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TESTS INSTRUMENT CLUSTER	
• Use the recorded instrument cluster DTCs from the continuous and on-demand self-test. • **Are any DTCs recorded?**	**Yes** If instrument cluster DTC U1073 is retrieved, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual to continue diagnosis. All other instrument cluster DTCs, REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Index. **No** GO to AA2 .
AA2 CARRY OUT THE INSTRUMENT CLUSTER WARNING LAMPS AND CHIME ACTIVE COMMAND USING THE DIAGNOSTIC TOOL	
• Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster WARNING LAMPS AND CHIME active command. Trigger the ALL LAMPS active command ON and OFF. Observe the engine over-temperature indicator. • **Does the engine over-temperature indicator illuminate and turn off?**	**Yes** Go To Pinpoint Test H . **No** GO to AA3 .
AA3 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test AB: The Air Bag Warning Indicator Is Never On

Normal Operation

The restraint control module is hardwired to the instrument cluster through circuit 31S-JA14 (BK/GN). When the restraint control module (RCM) detects a system concern, a DTC will be set and the restraint control module will remove the ground to the instrument cluster to turn on the AIR BAG warning indicator. RCM DTC B1869 will be set if circuit 31S-JA14 (BK/GN) is open or shorted to ground. RCM DTC B1870 will be set if circuit 31S-JA14 (BK/GN) is shorted to power.

Possible Causes

- circuit 31S-JA14 (BK/GN) open, short to ground or short to power
- RCM
- instrument cluster

PINPOINT TEST AB: THE AIR BAG WARNING INDICATOR IS NEVER ON

Test Step	Result / Action to Take
⚠ **CAUTION: Use the correct probe adaptor(s) when making measurements. Failure to use the correct probe adaptor(s) may damage the connector.**	
AB1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TESTS RESTRAINT CONTROL MODULE (RCM)	
• Use the recorded restraint control module (RCM) DTCs from the continuous and on-demand self-tests. • **Are any RCM DTCs recorded?**	**Yes** If RCM DTC B1869 or B1870 are retrieved, GO to AB3 . For all other RCM DTCs, REFER to Section 501-20B . **No** GO to AB2 .
AB2 CHECK THE RESTRAINT CONTROL MODULE (RCM) OPERATION	
NOTE: The resistance during this test should be greater than 10,000 ohms for approximately four seconds then switch to less than 5 ohms during bulb prove out. • Disconnect: Instrument Cluster C220a. • Key in ON position.	**Yes** GO to AB6 . **No** GO to AB3 .

• Measure the resistance between the instrument cluster C220a-22, circuit 31S-JA14 (BK/GN), harness side and ground.  A0060989 • **Is the resistance greater than 10,000 ohms during prove out then drop to less than 5 ohms?**	
AB3 CHECK CIRCUIT 31S-JA14 (BK/GN) FOR OPEN	
• Key in OFF position. • Deactivate the air bag supplemental restraint system (SRS). Refer to Section 501-20B . • Disconnect: Instrument Cluster C220a. • Disconnect: RCM C310a. • Measure the resistance between the instrument cluster C220a-22, circuit 31S-JA14 (BK/GN), harness side and the restraint control module C310a-19, circuit 31S-JA14 (BK/GN), harness side.  A0060990 • **Is the resistance less than 5 ohms?**	**Yes** GO to AB4 . **No** REPAIR the circuit. TEST the system for normal operation.
AB4 CHECK CIRCUIT 31S-JA14 (BK/GN) FOR SHORT TO POWER	
• Key in ON position. • Measure the voltage between the instrument cluster C220a-22, circuit 31S-JA14 (BK/GN), harness side and ground.  A0060991 • **Is any voltage indicated?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to AB5 .
AB5 CHECK FOR CORRECT RCM OPERATION	

• Disconnect all the RCM connectors.
• Check for:
  • corrosion
  • pushed-out pins
	Yes
	INSTALL a new RCM. REFER to Section 501-20B . TEST the system for normal operation.

• Connect all the RCM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. TEST the system for normal operation.
AB6 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test AC: The Check Fuel Cap Indicator Is Never/Always On

Normal Operation

The powertrain control module (PCM) monitors the fuel tank evaporative system for significant leaks that occur following refueling of the vehicle. If a fuel tank pressure change greater than a minus 23.7 kPa (7 inHg) of vacuum within 30 seconds after refueling has occurred, or there is excessive purge (fuel vapor) flow greater than 454 g (0.06 lb) per minute, the PCM will set DTC P0457 and send a message to the instrument cluster over the standard corporate protocol (SCP) communication network, circuits 4-EG8 (GY/VT) and 5-EG8 (BU/WH), to turn on the check fuel cap indicator.

Possible Causes

- PCM
- instrument cluster

PINPOINT TEST AC: THE CHECK FUEL CAP INDICATOR IS NEVER/ALWAYS ON

Test Step	Result / Action to Take
AC1 RETRIEVE AND RECORD DTCS FROM CONTINUOUS AND ON-DEMAND SELF-TESTS PCM	
NOTE: Once the check fuel cap indicator does turn on, it does not turn off unless the fuel cap has been correctly secured and the vehicle has been driven for several minutes. • Use the recorded PCM DTCs from the continuous and on-demand self-test. • **Are any DTCs recorded?**	**Yes** If PCM DTC P0457, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual to continue diagnosis. **No** GO to AC2 .

AC2 CARRY OUT THE INSTRUMENT CLUSTER WARNING LAMPS AND CHIME ACTIVE COMMAND USING THE DIAGNOSTIC TOOL	
• Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster WARNING LAMPS AND CHIME active command. Trigger the ALL WARNING LAMPS active command ON. Observe the CHECK FUEL CAP indicator. • **Does the CHECK FUEL CAP indicator illuminate?**	**Yes** GO to AC3 . **No** GO to AC4 .
AC3 CHECK FOR CORRECT POWERTRAIN CONTROL MODULE (PCM) OPERATION	

• Disconnect all the PCM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-04A or Section 303-04B .
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

AC4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they are seated correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test AD: The Integrated Circuit Display Is Inoperative

Normal Operation

The digital transmission range (TR) sensor is hardwired directly to the powertrain control module (PCM), which provides the instrument cluster with the transmission range data over the standard corporate protocol (SCP) communication network, circuits 4-EG8 (GY/VT) and 5-EG8 (BU/WH). The instrument cluster PRNDL display is controlled by the instrument cluster, indicating the appropriate range as transmitted to the instrument cluster by the digital TR sensor and the PCM. The front electronic module (FEM) and rear electronic module (REM) both control and monitor the exterior illumination. When an exterior lamp(s) is inoperative, the FEM or REM notify the instrument cluster over the SCP communication network and the instrument cluster will illuminate the warning center message LAMP OUT.

Possible Causes

- digital transmission range (TR) sensor
- PCM
- FEM
- REM
- instrument cluster

PINPOINT TEST AD: THE INTEGRATED CIRCUIT DISPLAY IS INOPERATIVE

Test Step	Result / Action to Take
⚠ **CAUTION: Use the correct probe adaptor(s) when making measurements. Failure to use the correct probe adaptor(s) may damage the connector.**	
AD1 VERIFY THE INTEGRATED CIRCUIT DISPLAY OPERATION	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select the instrument cluster DISPLAY SEGMENT CONTROL II active command. • Trigger the SEGMENTS active command. • **Do all of the segments illuminate?**	**Yes** If the PRNDL is inoperative, REFER to Section 307-01 . If the odometer is inoperative, Go To Pinpoint Test K . If the warning center display is inoperative, GO to AD2 **No** GO to AD4 .
AD2 MONITOR THE EXTERIOR LIGHTING	
• Key in ON position. • Place the headlamp switch in the parking lamps ON position. • Monitor the exterior lighting. • **Do all exterior operate correctly?**	**Yes** GO to AD3 . **No** REPAIR the exterior lights. REFER to Section 417-01 .
AD3 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TESTS FRONT ELECTRONIC MODULE (FEM) AND REAR ELECTRONIC MODULE (REM)	
• Use the recorded rear electronic module (REM) and front electronic module (FEM) DTCs from the continuous and on-demand self-test. • **Are any FEM or REM DTCs recorded?**	**Yes** REPAIR the FEM DTCs. REFER to Section 418-00 . **No** GO to AD4 .
AD4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.

• Connect all the instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test AE: The Instrument Cluster Is Inoperative

Normal Operation

With the key in the START/RUN position, the instrument cluster receives power from the central junction box (CJB) fuse(s) 4 (5A), circuit 15-GG14 (GN/RD) and 17 (5A), circuit 15-JA14 (GN/BK), while in the RUN/ACC position, power is received from the CJB fuse 13 (5A), circuit 75-GG15 (YE/GN). With the key in the OFF position, the instrument cluster receives its keep-alive power from the CJB fuse 20 (10A), circuit 29-GG11 (OG/BU). The instrument cluster grounding is accomplished through circuit 91-GG11 (BK/BU).

Possible Causes

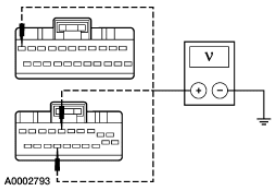
- central junction box (CJB) fuse(s): 4 (5A), 13 (5A), 17 (5A) and 20 (10A)
- battery junction box (BJB) fuse 25 (40A)
- circuit 15-GG14 (GN/RD) open or short to ground
- circuit 15-JA14 (GN/BK) open or short to ground
- circuit 75-GG15 (YE/GN) open or short to ground
- circuit 29-GG11 (OG/BU) open or short to ground
- circuit 91-GG11 (BK/BU) open or short to power
- instrument cluster

PINPOINT TEST AE: THE INSTRUMENT CLUSTER IS INOPERATIVE

Test Step	Result / Action to Take
⚠ **CAUTION: Use the correct probe adaptor(s) when making measurements. Failure to use the correct probe adaptor(s) may damage the connector.**	
AE1 CHECK HOT AT ALL TIMES POWER SUPPLY CIRCUIT	
• Key in OFF position. • Disconnect: Instrument Cluster C220b. • Measure the voltage between the instrument cluster C220b-3, circuit 29-GG11 (OG/BU), harness side and ground.  A0002792 • **Is the voltage greater than 10 volts?**	**Yes** GO to AE2 . **No** REPAIR the circuit. TEST the system for normal operation.
AE2 CHECK HOT IN RUN POWER SUPPLY CIRCUITS	

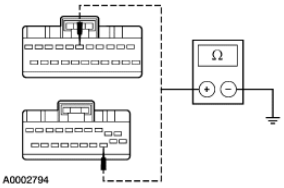
<table>
<tr><td>
• Disconnect: Instrument Cluster C220a.
• Key in ON position.
• Measure the voltage between the instrument cluster and ground as follows:

<table>
<tr><th>Connector Pin</th><th>Circuit</th></tr>
<tr><td>C220a-11</td><td>15-JA14 (GN/BK)</td></tr>
<tr><td>C220b-6</td><td>15-GG14 (GN/RD)</td></tr>
<tr><td>C220b-17</td><td>75-GG15 (YE/GN)</td></tr>
</table>



• Are the voltages greater than 10 volts?
</td><td>
Yes
GO to AE3 .

No
REPAIR the circuit in question. TEST the system for normal operation.
</td></tr>
<tr><td>AE3 CHECK GROUND CIRCUITS</td><td></td></tr>
<tr><td>
• Key in OFF position.
• Measure the resistance between the instrument cluster C220b-13, circuit 91-GG11 (BK/BU), harness side and ground; and between the instrument cluster C220a-6, circuit 31-AL11 (BK), harness side and ground.



• Are the resistances less than 5 ohms?
</td><td>
Yes
GO to AE4 .

No
REPAIR the circuit in question. TEST the system for normal operation.
</td></tr>
<tr><td>AE4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION</td><td></td></tr>
<tr><td>
• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• Is the concern still present?
</td><td>
Yes
INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.

No
The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
</td></tr>
</table>

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052 or equivalent diagnostic tool with the appropriate adaptor cable

Inspection and Verification

NOTE: The instrument cluster and the front electronic module (FEM) must be reconfigured upon installation. Refer to Section 418-00 .

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical and electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Horns • Horn switches • Horn relay • Clockspring	• Central junction box (CJB) fuses: ♦ 4 (5A) ♦ 13 (5A) ♦ 17 (5A) ♦ 20 (10A) • Battery junction box (BJB) fuses: ♦ 22 (20A) ♦ 25 (40A) • Auxiliary junction box (AJB) fuse(s): ♦ 4 (15A) • Circuitry • Horn relay

	• Loose or corroded connections • Clockspring

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, connect the diagnostic tool to the data link connector (DLC) and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
   - check that the program card is correctly installed.
   - check the connections to the vehicle.
   - check the ignition switch position.

5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

6. Carry out the diagnostic tool data link test. If the diagnostic tool responds with:
   - SCP+ or SCP- circuit fault; all electronic control units no response/not equipped, refer to Section 418-00 .
   - No response/not equipped for the instrument cluster, Go To Pinpoint Test F .
   - No response/not equipped for the FEM, REFER to Section 418-00 .
   - System passed, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out self-test diagnostics for the instrument cluster and FEM.

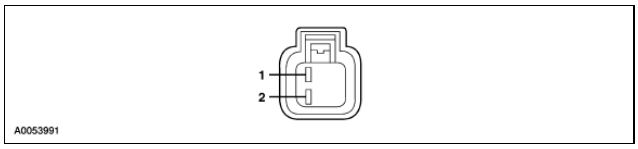
7. If the DTCs retrieved are related to the concern, refer to Section 418-00 to continue diagnostics.

8. If no DTCs related to the concern are retrieved, GO to Symptom Chart to continue diagnostics.

Symptom Chart

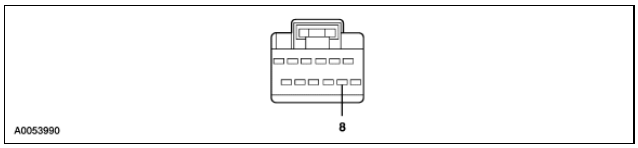
Symptom Chart
Circuit Reference

Horn C131



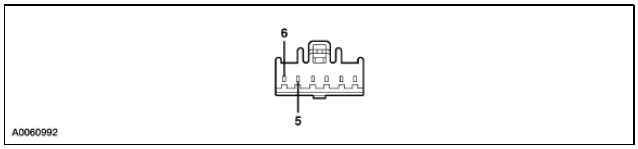
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	Circuit 30S-GJ6 (RD/YE) power feed to the horn	Greater than 10 volts when the horn switch is pressed and 0 voltage when the horn switch is released. Less than 5 ohms resistance between the horn and the horn relay. Greater than 10,000 ohms resistance between the horn and ground.
2	Circuit 31-GJ6 (BK/YE) ground	0 voltage, less than 5 ohms resistance between the horn and ground.

Front Electronic Module (FEM) C201c



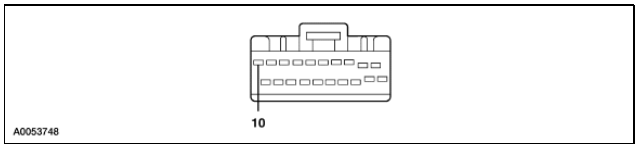
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
8	Circuit 91S-GJ7 (BN/RD) switched ground circuit	0 voltage, less than 5 ohms resistance between the front electronic module (FEM) and the horn relay. Greater than 10,000 ohms resistance between the FEM and ground.

Clockspring C218b



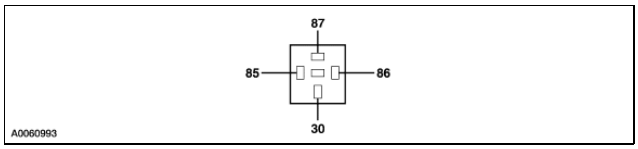
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
5	Circuit 31-GJ1 (BK/BU) switched ground circuit	0 voltage, less than 5 ohms resistance between the clockspring and ground.
6	Circuit 10-GJ9 (GY/OG) horn input to the instrument cluster	0 voltage, less than 5 ohms resistance between the clockspring and the instrument cluster. Greater than 10,000 ohms resistance between the steering wheel switch and ground.

Instrument Cluster Module C220b



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
10	Circuit 10-GJ9 (GY/OG) ground	0 voltage, less than 5 ohms resistance between the instrument cluster and the steering wheel switch. Greater than 10,000 ohms resistance between the instrument cluster and ground.

Horn Relay C1006



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
30	Circuit 30-GJ7A (RD/BU) horn relay power	Greater than 10 volts at all times. Less than 5 ohms resistance between the horn relay and the auxiliary junction box. Greater than 10,000 ohms resistance between the horn relay and ground.
85	Circuit 30-GJ7B (RD/BU) horn relay power	Greater than 10 volts at all times. Less than 5 ohms resistance between the horn relay and the auxiliary junction box. Greater than 10,000 ohms resistance between the horn relay and ground.
86	Circuit 91S-GJ7 (BN/RD) switched ground circuit	0 voltage, less than 5 ohms resistance between the horn relay and the front electronic module (FEM).
87	Circuit 30S-GJ6 (RD/YE) power feed to the horn	Greater than 10 volts when the horn switch is pressed and 0 voltage when the horn switch is released. Less than 5 ohms resistance between the horn relay and the horn. Greater than 10,000 ohms resistance between the horn and ground.

Pinpoint Test AF: The Horn is Inoperative

Normal Operation

The horn switches are grounded through the clockspring by circuit 31-GJ1 (BK/BU). The clockspring provides this ground signal to the instrument cluster through the horn switch on circuit 10-GJ9 (GY/OG). The horn relay control and switched B+ power circuits are supplied by auxiliary junction box fuse 4 (15A) through circuit 30-GJ7 (BN/RD). The horn relay ground is controlled by the front electronic module (FEM) through circuit 91S-GJ7 (BN/RD). When the horn switch is pressed, the instrument cluster sends the FEM a command signal over the standard corporate protocol (SCP) communication network, circuits 4-EG8 (GY/VT) and 5-EG8 (BU/WH) to ground the horn relay. The FEM supplies a ground, energizing the horn relay and supplying power to the horn through circuit 30S-GJ6 (RD/YE).

Possible Causes

- auxiliary junction box fuse:
  - 4 (15A)
- circuit 10-GJ9 (GY/OG) open
- circuit 30-GJ7A (RD/BU) open or shorted to ground
- circuit 30-GJ7B (RD/BU) open or shorted to ground
- circuit 30S-GJ6 (RD/YE) open or shorted to ground
- circuit 31-GJ1 (BK/BU) open
- circuit 31-GJ6 (BK/YE) open
- circuit 91S-GJ7 (BN/RD) open
- clockspring
- horn relay
- horn
- horn switches
- FEM
- instrument cluster

PINPOINT TEST AF: THE HORN IS INOPERATIVE

Test Step	Result / Action to Take
⚠ CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connectors.	
AF1 CHECK HORN INPUT PID TO THE INSTRUMENT CLUSTER	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster PID. • Monitor the instrument cluster horn switch PID while pressing and releasing the horn switch. • **Does the PID indicate ON with the horn switch pressed, and OFF with the horn switch released?**	**Yes** GO to AF2 . **No** GO to AF3 .
AF2 INITIATE THE HORN CONTROL ACTIVE COMMAND	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Trigger the instrument cluster HORN CONTROL active command. • **Does the horn sound?**	**Yes** GO to AF13 . **No** GO to AF7 .
AF3 CHECK THE OPERATION OF THE HORN SWITCH	
• Key in OFF position. • Remove the driver air bag. Refer to Section 501-20B . • Disconnect: Horn Switch Connector. • Connect a fused (5A) jumper wire between the horn switch connector pin 5, harness side and the horn switch connector pin 6, harness side. A0060994 • **Does the horn sound?**	**Yes** INSTALL a new horn switch. REFER to Horn Switch in this section. Test the system for normal operation. **No** GO to AF4 .
AF4 CHECK THE OPERATION OF THE CLOCKSPRING	
• Disconnect: Clockspring C218b • Connect a fused (5A) jumper wire between the clockspring C218b-6, circuit 10-GJ9 (GY/OG), harness side and the clockspring C218b-5, circuit 31-GJ1 (BK/BU), harness side.	**Yes** INSTALL a new clockspring. REFER to Section 501-20B . **No** GO to AF5 .

 A0060995 • **Does the horn sound?**	
AF5 CHECK CIRCUIT 10-GJ9 (GY/OG) FOR AN OPEN	
• Disconnect: Instrument Cluster C220b. • Measure the resistance between the instrument cluster C220b-10, circuit 10-GJ9 (GY/OG), harness side and the clockspring C218b-6, circuit 10-GJ9 (GY/OG), harness side.  A0060996 • **Is the resistance less than 5 ohms?**	**Yes** GO to AF6 . **No** REPAIR the circuit. Test the system for normal operation.
AF6 CHECK CIRCUIT 31-GJ1 (BK/BU) FOR AN OPEN	
• Measure the resistance between the clockspring C218b-5, circuit 31-GJ1 (BK/BU), harness side and ground.  A0060997 • **Is the resistance less than 5 ohms?**	**Yes** GO to AF13 . **No** REPAIR the circuit. Test the system for normal operation.
AF7 CHECK THE OPERATION OF THE HORN RELAY	
• Key in OFF position. • Disconnect: Horn Relay C1006. • Carry out the horn relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the relay OK?**	**Yes** GO to AF8 . **No** INSTALL a new horn relay. Test the system for normal operation.
AF8 CHECK CIRCUITS 30-GJ7A (RD/BU) AND 30-GJ7B (RD/BU) FOR AN OPEN	
• Key in ON position. • Measure the voltage between the horn relay C1006-30, circuit 30-GJ7A (RD/BU), harness side and ground; and between the horn relay C1006-85, circuit 30-GJ7B (RD/BU), harness side and ground.	**Yes** GO to AF9 . **No** REPAIR the circuit. Test the system for normal operation.

 A0060998 • **Are the voltages greater than 10 volts?**	
AF9 CHECK THE HORN OPERATION	
• Key in OFF position. • Connect a fused (5A) jumper wire between the horn relay C1006-87, circuit 30S-GJ6 (RD/YE), harness side and the horn relay C1006-30, circuit 30-GJ7A (RD/BU), harness side.  A0060999 • **Does the horn sound?**	**Yes** GO to AF10 . **No** GO to AF11 .
AF10 CHECK CIRCUIT 91S-GJ7 (BN/RD) FOR AN OPEN	
• Key in OFF position. • Disconnect: Front Electronic Module (FEM) C201c. • Measure the resistance between the horn relay C1006-86, circuit 91S-GJ7 (BN/RD), harness side and the FEM C201c-8, circuit 91S-GJ7 (BN/RD), harness side.  A0061000 • **Is the resistance less than 5 ohms?**	**Yes** GO to AF14 . **No** REPAIR the circuit. Test the system for normal operation.
AF11 CHECK CIRCUIT 30S-GJ6 (RD/YE) FOR AN OPEN	
• Key in OFF position. • Disconnect Horn C131. • Measure the resistance between the horn relay C1006-87, circuit 30S-GJ6 (RD/YE), harness side and the horn C131-1, circuit 30S-GJ6 (RD/YE), harness side.  A0061001 • **Is the resistance less than 5 ohms?**	**Yes** GO to AF12 . **No** REPAIR the circuit. Test the system for normal operation.

AF12 CHECK CIRCUIT 31-GJ6 (BK/YE) FOR AN OPEN	
• Measure the resistance between the horn C131-2, circuit 31-GJ6 (BK/YE), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new horn. REFER to Horn in this section. Test the system for normal operation. **No** REPAIR the circuit. Test the system for normal operation.
AF13 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

AF14 CHECK FOR CORRECT FRONT ELECTRONIC MODULE (FEM) OPERATION	

• Disconnect all the FEM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the FEM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FEM. REFER to Section 418-00 .
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test AG: The Horn is Always On

Normal Operation

The horn switches are grounded through the clockspring by circuit 31-GJ1 (BK/BU). The clockspring provides this ground signal to the instrument cluster through the horn switch on circuit 10-GJ9 (GY/OG). The horn relay control and switched B+ power circuits are supplied by auxiliary junction box fuse 4 (15A) through circuit 30-GJ7 (BN/RD). The horn relay ground is controlled by the front electronic module (FEM) through circuit 91S-GJ7 (BN/RD). When the horn switch is pressed, the instrument cluster sends the FEM a command signal over the standard corporate protocol (SCP) communication network, circuits 4-EG8 (GY/VT) and 5-EG8 (BU/WH) to ground the horn relay. The FEM supplies a ground, energizing the horn relay and supplying power to the horn through circuit 30S-GJ6 (RD/YE).

Possible Causes

- auxiliary junction box fuse 4 (15A)
- circuit 10-GJ9 (GY/OG) shorted to ground
- circuit 30S-GJ6 (RD/YE) shorted to power

- circuit 91S-GJ7 (BN/RD) shorted to ground
- clockspring
- horn relay
- horn
- horn switches
- FEM
- instrument cluster

PINPOINT TEST AG: THE HORN IS ALWAYS ON

Test Step	Result / Action to Take
AG1 CHECK HORN INPUT PID FROM THE INSTRUMENT CLUSTER	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster PID. • Monitor the instrument cluster horn switch PID. • **Does the PID always indicate ON?**	**Yes** GO to AG2 . **No** GO to AG5 .
AG2 CHECK THE HORN SWITCH OPERATION	
• Key in OFF position. • Deactivate the air bag system; refer to Section 501-20B . • Disconnect horn switch. • **Does the horn stop?**	**Yes** INSTALL a new horn switch. REFER to Horn Switch in this section. Test the system for normal operation. **No** GO to AG3 .
AG3 CHECK THE CLOCKSPRING OPERATION	
• Disconnect: Clockspring C218b. • **Does the horn stop?**	**Yes** INSTALL a new clockspring. REFER to Section 501-20B . Test the system for normal operation. **No** GO to AG4 .
AG4 CHECK CIRCUIT 10GJ-9 (GY/OG) FOR SHORT TO GROUND	
• Disconnect: Instrument Cluster C220b. • Measure the resistance between the instrument cluster C220b-10, circuit 10-GJ9 (GY/OG), harness side and ground.  	**Yes** GO to AG9 . **No** REPAIR the circuit. Test the system for normal operation.

• **Is the resistance greater than 10,000 ohms?**	
AG5 CHECK CIRCUIT 30S-GJ6 (RD/YE) FOR A SHORT TO POWER	
• Disconnect: Horn Relay C1006. • **Does the horn stop?**	**Yes** GO to AG6 . **No** REPAIR circuit 30S-GJ6 (RD/YE) for short to power. Test the system for normal operation.
AG6 CHECK THE HORN RELAY OPERATION	
• Key in OFF position. • Disconnect: Horn Relay C1006. • Carry out the relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the relay OK?**	**Yes** GO to AG7 . **No** INSTALL a new horn relay. Test the system for normal operation.
AG7 CHECK CIRCUIT 91S-GJ7 (BK/RD) AND THE FEM FOR A SHORT TO GROUND	
• Disconnect: Front Electronic Module (FEM) C201c. • Measure the resistance between horn relay C1006-86, circuit 91S-GJ7 (BN/RD), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to AG8 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
AG8 CHECK FOR CORRECT FRONT ELECTRONIC MODULE (FEM) OPERATION	

• Disconnect all the FEM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the FEM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FEM. REFER to Section 418-00 .
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

AG9 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all the instrument cluster connectors. • Check for: • corrosion	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section.

• pushed-out pins • Connect all the instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Information And Message Center Printable View (148 KB)

Refer to Wiring Diagrams Cell 66 , for schematic and connector information.

Special Tool(s)

ST1137-A	73 III Automotive Meter 105-R0057 or equivalent
ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052, or equivalent diagnostic tool with the appropriate adaptor cable

Inspection and Verification

NOTE: A new instrument cluster and FEM must be reconfigured upon installation. Refer to Section 418-00 .

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Washer fluid level • Fuel tank • Engine coolant level • Accessory drive belt • Engine oil level • Brake fluid level	• Central junction box (CJB) fuse(s): ♦ 4 (5A) ♦ 13 (5A) ♦ 17 (5A) ♦ 20 (10A) • Battery junction box (BJB) fuse(s): ♦ 15 (40A) ♦ 22 (20A) ♦ 25 (40A) • Circuitry. • Instrument cluster.

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, connect the diagnostic tool to the data link connector and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
    - check that the program card is correctly installed.
    - check the connections to the vehicle.
    - check the ignition switch position.

5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

6. Carry out the diagnostic tool data link test. If the diagnostic tool responds with:
    - SCP+ or SCP- circuit fault; all electronic control units no response/not equipped, refer to Section 418-00 .
    - No response/not equipped for the instrument cluster, Go To Pinpoint Test F .
    - No response/not equipped for the electronic parking brake module, Section 206-00 .
    - No response/not equipped for the FEM, REFER to Section 418-00 .
    - System passed, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out the self-test diagnostics for the instrument cluster.

7. If the DTCs retrieved are related to the concern, go to the Diagnostic Trouble Code (DTC) Index.

8. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

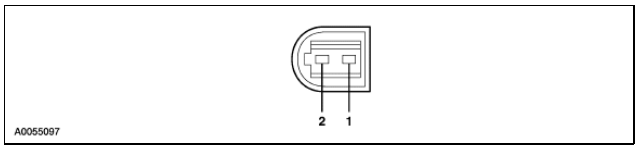
Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1205	EIC Switch-1 Assembly Circuit Failure	Instrument Cluster	Go To Pinpoint Test AJ .
B1342	ECU Defective	Instrument Cluster	CLEAR and DOCUMENT the DTCs. CARRY OUT the instrument cluster self-test. INSTALL a new instrument cluster if the DTC B1342 is retrieved again. REFER to Instrument Cluster in this section.
B1479	Low Washer Fluid Level Switch Circuit Failure	FEM	Go To Pinpoint Test AM .
B1676	Battery Voltage Out of Range	Instrument Cluster	REPAIR the charging system. REFER to Section 414-00 .
B2477	Module Configuration Failure	Instrument Cluster	REPAIR the module configuration. REFER to Section 418-00 .

Symptom Chart

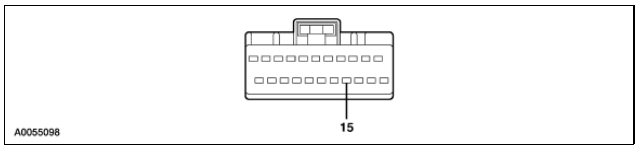
Symptom Chart
Connector Circuit Reference

Washer Fluid Level Switch C138



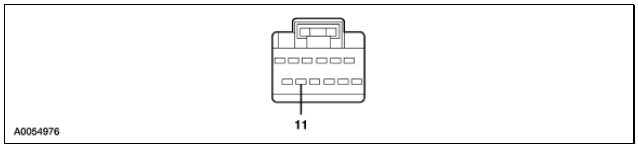
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	Circuit 31-GC8 (BK/OG) signal return ground circuit	0 voltage, less than 5 ohms of resistance between the washer fluid level switch and ground.
2	Circuit 8-GC8 (WH/BU) signal from the FEM to the washer fluid level switch.	Less than 5 ohms of resistance between the FEM and the washer fluid level switch. Greater than 10,000 ohms of resistance between the washer fluid level switch and ground.

FEM C201b



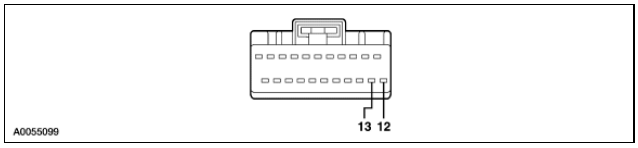
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
15	Circuit 8-GC8 (WH/BU) signal from the FEM to the washer fluid level switch.	Less than 5 ohms of resistance between the FEM and the washer fluid level switch. Greater than 10,000 ohms of resistance between the washer fluid level switch and ground.

FEM C201c



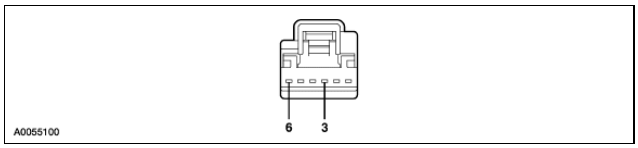
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
11	Circuit 8-GC7 (WH/RD) signal circuit to the brake fluid level switch from the FEM.	5 ohms or less between the brake fluid level switch and the FEM.

Instrument Cluster C220a



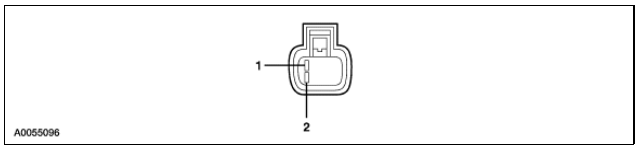
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
12	Circuit 9-GG25 (BN/WH) signal circuit from the instrument cluster to the message center switch.	0 voltage, less than 5 ohms of resistance between the message center switch and the instrument cluster. Greater than 10,000 ohms of resistance between the message center switch and ground.
13	Circuit 7-GG25 (YE/VT) signal return circuit from the message center switch to the instrument cluster.	0 voltage, less than 5 ohms of resistance between the message center switch and the instrument cluster. Greater than 10,000 ohms of resistance between the message center switch and ground.

Message Center Switch C253



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
3	Circuit 7-GG25 (YE/VT) signal return circuit from the message center switch to the instrument cluster.	0 voltage, less than 5 ohms of resistance between the message center switch and the instrument cluster. Greater than 10,000 ohms of resistance between the message center switch and ground.
6	Circuit 9-GG25 (BN/WH) signal circuit from the instrument cluster to the message center switch.	0 voltage, less than 5 ohms of resistance between the message center switch and the instrument cluster. Greater than 10,000 ohms of resistance between the message center switch and ground.

Brake Fluid Level Switch C1395



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	Circuit 8-GC7 (WH/RD) signal circuit to the brake fluid level switch from the FEM.	5 ohms or less between the brake fluid level switch and the FEM.
2	Circuit 31-GC7 (BK/BU) ground circuit from the brake fluid level switch.	5 ohms or less between the brake fluid level switch and ground.

Pinpoint Test AH: The Message Center Is Not Operating Correctly

Normal Operation

The message center display is located in the lower right side of the instrument cluster.

Possible Causes

- instrument cluster
- circuitry
- message center switch

PINPOINT TEST AH: THE MESSAGE CENTER IS NOT OPERATING CORRECTLY

Test Step	Result / Action to Take
AH1 RETRIEVE THE RECORDED DTCS FROM BOTH THE CONTINUOUS AND ON-DEMAND SELF-TESTS INSTRUMENT CLUSTER	
• Key in ON position. • Connect the diagnostic tool. • Enter the following diagnostic mode on the diagnostic tool: Self-Test. • **Are any DTCs recorded?**	**Yes** Section 418-00 to continue diagnosis. **No** GO to AH2 .
AH2 CHECK THE MESSAGE CENTER DISPLAY OPERATION	
• Enter the following diagnostic mode on the diagnostic tool: Active Commands. • Command all display segments ON. • **Does the message center display illuminate all segments?**	**Yes** The system is OK. If the FUEL, RESET, SETUP or STATUS buttons are inoperative, Go To Pinpoint Test AJ . **No** GO to AH3 .
AH3 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test AI: The Lampout Warning Indicator Is Inoperative

Normal Operation

The FEM and REM communicate the lamp status to the instrument cluster over the SCP network. The message center uses that information to display when a lamp is out.

Possible Causes

- instrument cluster

PINPOINT TEST AI: THE LAMPOUT WARNING INDICATOR IS INOPERATIVE

Test Step	Result / Action to Take
NOTE: Verify that the FEM and REM operate correctly and communicate with the instrument cluster and message center.	
AI1 CHECK THE EXTERIOR LIGHTS OPERATION	
• Operate all the exterior lights. Monitor the operation of all the exterior lights. • **Do all the exterior lights operate correctly?**	**Yes** GO to AI2 . **No** REPAIR the exterior lights. REFER to Section 417-01 .
AI2 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test AJ: The Message Center Switch Does Not Operate Correctly

Normal Operation

The message center switch assembly uses circuits 9-GG25 (BN/WH) and 7-GG25 (YE/VT) to communicate the requested switch function to the message center.

Possible Causes

- circuit 9-GG25 (BN/WH) open or shorted
- circuit 7-GG25 (YE/VT) open or shorted
- message center switch assembly
- instrument cluster

PINPOINT TEST AJ: THE MESSAGE CENTER SWITCH DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
AJ1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TESTS INSTRUMENT CLUSTER	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Self-Test. • **Are any instrument cluster DTCs recorded?**	**Yes** If instrument cluster DTC B1205, GO to AJ3 . For all other instrument cluster DTCs, REFER to Section 418-00 . **No** GO to AJ2 .
AJ2 CHECK THE PID FOR THE MESSAGE CENTER SWITCH	
• Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster PID. • Select and monitor the message center switch PIDs FUELSW, RESETSW, SETUPSW and STATUSSW while pressing each message center button (FUEL, RESET, SETUP and STATUS). • **Does each PID agree with each button position?**	**Yes** GO to AJ5 . **No** GO to AJ3 .
AJ3 CHECK THE MESSAGE CENTER SWITCH CIRCUIT 9-GG25 (BN/WH) FOR OPEN AND SHORT TO GROUND	
• Key in OFF position. • Disconnect: Instrument Cluster C220a. • Disconnect: Message Center Switch C253. • Measure the resistance between the instrument cluster C220a-12, circuit 9-GG25 (BN/WH), harness side and the message center switch C253-6, circuit 9-GG25 (BN/WH), harness side; and between the instrument cluster C220a-12, circuit 9-GG25 (BN/WH), harness side and ground.  • **Is the resistance less than 5 ohms between the instrument cluster and the message center switch; and greater than 10,000 ohms between the instrument cluster and ground?**	**Yes** GO to AJ4 . **No** REPAIR the circuit. TEST the system for normal operation.
AJ4 CHECK THE MESSAGE CENTER SWITCH CIRCUIT 7-GG25 (YE/VT) FOR OPEN AND SHORT TO GROUND	

• Measure the resistance between the instrument cluster C220a-13, circuit 7-GG25 (YE/VT), harness side and the message center switch C253-3, circuit 7-GG25 (YE/VT), harness side; and between the instrument cluster C220a-13, circuit 7-GG25 (YE/VT), harness side and ground.  • **Is the resistance less than 5 ohms between the instrument cluster and the message center switch; and greater than 10,000 ohms between the instrument cluster and ground?**	**Yes** INSTALL a new message center switch. REFER to Message Center in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
AJ5 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test AK: The Indicator does Not Operate Correctly Low Fuel Level Display

Normal Operation

The fuel level status is communicated to the instrument cluster over the SCP network. The instrument cluster then communicates the fuel level status to the message center.

Possible Causes

- fuel pump module
- instrument cluster
- REM

PINPOINT TEST AK: THE INDICATOR DOES NOT OPERATE CORRECTLY LOW FUEL LEVEL DISPLAY

Test Step	Result / Action to Take
AK1 RETRIEVE THE RECORDED DTC FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TESTS REM AND INSTRUMENT CLUSTER	
NOTE: The fuel gauge does not change indication unless there have been at least 11 liters (three gallons) of fuel added or removed between ignition switch cycles.	**Yes** If any REM DTCs or instrument cluster DTCs are retrieved, REFER to Section 418-00 to continue diagnosis.

• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: REM Self-Test. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Self-Test. • **Are any DTCs recorded?**	**No** GO to AK2 .
AK2 CHECK THE FUEL GAUGE OPERATION	
• Key in OFF position. • Key in ON position. • Observe the fuel gauge operation. • **Does the fuel gauge operate correctly?**	**Yes** GO to AK3 . **No** Go To Pinpoint Test I .
AK3 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test AL: The Indicator Is Inoperative Oil Life Status, A/C Filter Life

Normal Operation

The instrument cluster tracks the engine run time and mileage. The message center uses that information to display the remaining interval until the next recommended maintenance procedure.

Possible Causes

- odometer
- instrument cluster

PINPOINT TEST AL: THE INDICATOR IS INOPERATIVE OIL LIFE STATUS, A/C FILTER LIFE

Test Step	Result / Action to Take
AL1 CHECK THE ODOMETER OPERATION	
• Key in ON position. • Monitor the odometer operation. • **Does the odometer operate correctly?**	**Yes** GO to AL2 . **No** Go To Pinpoint Test K .
AL2 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test AM: The Indicator Does Not Operate Correctly Low Washer Fluid Level Display

Normal Operation

The washer fluid level switch circuit 8-GC8 (WH/BU) is open when the washer fluid level is high. When the washer fluid level is low, the switch will close circuit 8-GC8 (WH/BU) with the ground circuit 31-GC8 (BK/OG) to signal the FEM that the washer fluid level is low. The FEM communicates the washer fluid level status to the instrument cluster over the SCP network. The message center uses that information to display the low washer fluid message.

Possible Causes

- circuit 8-GC8 (WH/BU) open or shorted
- circuit 31-GC8 (BK/OG) open
- instrument cluster
- washer fluid level switch
- FEM

PINPOINT TEST AM: THE INDICATOR DOES NOT OPERATE CORRECTLY LOW WASHER FLUID LEVEL DISPLAY

Test Step	Result / Action to Take
AM1 CHECK THE LOW WASHER FLUID MESSAGE DISPLAY	
• Disconnect: Washer Fluid Level Switch C138. • Connect a fused (5A) jumper wire between the washer fluid level switch C138-2, circuit 8-GC8 (WH/BU), harness side and ground.  A0004841 • Key in START position. • **Does the message center display LOW WASHER FLUID?**	**Yes** GO to AM2 . **No** DISCONNECT the jumper wire. GO to AM3 .
AM2 CHECK CIRCUIT 31-GC8 (BK/OG) FOR OPEN	

• Key in OFF position. • Measure the resistance between the washer fluid level switch C138-1, circuit 31-GC8 (BK/OG), harness side and ground.  A0004810 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new washer fluid level switch. CLEAR the DTCs. TEST the system for normal operation. **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.
AM3 CHECK THE FEM PID	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: FEM PID WFLUID. • Monitor the PID. • Key in OFF position. • Connect a fused (5A) jumper wire between the washer fluid level switch C138-2, circuit 8-GC8 (WH/BU), harness side and ground.  A0004841 • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: FEM PID WFLUID. • Monitor the PID. • **Does the PID read OK with the washer fluid level switch disconnected and LOW with the jumper wire connected?**	**Yes** GO to AM5 . **No** GO to AM4 .
AM4 CHECK CIRCUIT 8-GC8 (WH/BU) FOR OPEN OR SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between the washer fluid level switch C138-2, circuit 8-GC8 (WH/BU), harness side and the FEM C201b-15, circuit 8-GC8 (WH/BU), harness side; and measure the resistance between the washer fluid level switch C138-2, circuit 8-GC8 (WH/BU), harness side and ground.  A0061004 • **Is the resistance less than 5 ohms between the connectors and greater than 10,000 ohms between the washer fluid**	**Yes** GO to AM6 . **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.

level switch and ground?	
AM5 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

AM6 CHECK FOR CORRECT FEM OPERATION	

• Disconnect all the FEM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the FEM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FEM. REFER to Section 418-00 . CLEAR the DTCs. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test AN: The Indicator Does Not Operate Correctly Low Brake Fluid Level Display

Normal Operation

The brake fluid level switch circuit 8-GC7 (WH/RD) is open when the brake fluid level is high. When the brake fluid level is low, the switch will close circuit 8-GC7 (WH/RD) with the ground circuit 31-GC7 (BK/BU) to signal the FEM that the brake fluid level is low. The FEM communicates the brake fluid level status to the instrument cluster over the SCP network. The message center uses that information to display the low brake fluid message.

Possible Causes

- circuit 8-GC7 (WH/RD) open
- circuit 31-GC7 (BK/BU) open
- brake fluid switch
- instrument cluster

PINPOINT TEST AN: THE INDICATOR DOES NOT OPERATE CORRECTLY LOW BRAKE FLUID LEVEL DISPLAY

Test Step	Result / Action to Take
AN1 CHECK THE INSTRUMENT CLUSTER BRAKE WARNING INDICATOR ILLUMINATION	
• Connect the diagnostic tool. • Key in ON position.	**Yes** GO to AN2 . **No**

• Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Active Command. • Select instrument cluster warning lamps and chime and trigger ON the active command ALL LAMPS. • Select instrument cluster warning lamps and chime and trigger OFF the activate command ALL LAMPS. • **Does the BRAKE warning indicator illuminate when triggered ON, and go off when triggered OFF?**	GO to AN7 .
AN2 CHECK BRAKE WARNING INDICATOR	
• Key in OFF position. • Key in ON position. • Monitor the BRAKE warning indicator. • **Does the BRAKE warning indicator continue to illuminate after prove-out?**	**Yes** REFER to Section 206-00 continue the diagnosis. **No** GO to AN3 .
AN3 CHECK LOW BRAKE FLUID LEVEL DISPLAY	
• Key in START position. • Monitor the message center for the LOW BRAKE FLUID LEVEL message. • **Is the LOW BRAKE FLUID LEVEL message always displayed?**	**Yes** GO to AN7 . **No** GO to AN4 .
AN4 CHECK FEM BRAKE FLUID LEVEL PID	
• Key in OFF position. • Disconnect: Brake Fluid Level Switch C1395. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: FEM Brake Status PID. • Monitor the brake fluid level switch PID. • Connect a fused (5A) jumper wire between the brake fluid warning switch C1395-1, circuit 8-GC7 (WH/RD), harness side and the brake fluid warning switch C1395-2 circuit 31-GC7 (BK/BU), harness side. A0060988 • Monitor the brake fluid level switch PID. • **Does the PID read OFF when the jumper wire is not connected and ON when the jumper wire is connected?**	**Yes** GO to AN7 . **No** GO to AN5 .
AN5 CHECK CIRCUIT 8-GC7 (WH/RD) FOR OPEN	
• Key in OFF position. • Disconnect: FEM C201c. • Measure the resistance between the brake fluid level switch C1395-1, circuit 8-GC7 (WH/RD) and the FEM C201c-11, circuit 8-GC7 (WH/RD), harness side.	**Yes** GO to AN6 . **No** REPAIR the circuit. TEST the system for normal operation.

 A0061005 • **Is the resistance less than 5 ohms?**	
AN6 CHECK CIRCUIT 31-GC7 (BK/BU) FOR OPEN	
• Measure the resistance between the brake fluid level switch C1395-2, circuit 31-GC7 (BK/BU), harness side and ground.  A0061006 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new brake fluid level switch. REFER to Section 206-00 . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
AN7 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test AO: The Indicator Does Not Operate Correctly Door Ajar Display

Normal Operation

The FEM and REM communicate the door ajar status to the instrument cluster over the SCP network. The message center uses that information to display the door ajar message.

Possible Causes

- instrument cluster
- door ajar switch

PINPOINT TEST AO: THE INDICATOR DOES NOT OPERATE CORRECTLY DOOR AJAR DISPLAY

Test Step	Result / Action to Take
AO1 CHECK THE INTERIOR DOME LAMP OPERATION	

NOTE: The instrument panel dimmer switch must be in the door position, not the courtesy position. • Open and close each of the doors. • **Does the interior dome lamp operate correctly?**	**Yes** GO to AO2 . **No** REPAIR the interior dome lamp. REFER to Section 417-02 .
AO2 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TESTS FEM AND REM	
• Use recorded FEM and REM DTCs from the continuous and on-demand self-test. • **Are any FEM or REM DTCs recorded?**	**Yes** REFER to Section 418-00 . **No** GO to AO3 .
AO3 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test AP: The Indicator Does Not Operate Correctly Traction Control

Normal Operation

The traction control indicator is an output signal that is controlled by the anti-lock brake system/stability assist module. The ABS/stability assist module communicates the traction control status to the instrument cluster over the SCP network. The message center uses that information to display the traction control message.

Possible Causes

- ABS/stability assist system module
- instrument cluster

PINPOINT TEST AP: THE INDICATOR DOES NOT OPERATE CORRECTLY TRACTION CONTROL

Test Step	Result / Action to Take
AP1 RETRIEVE AND RECORD DTCS FROM CONTINUOUS AND ON-DEMAND SELF-TESTS ABS/STABILITY ASSIST MODULE	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: ABS/Stability Assist Module Self-Test. • **Are any DTCs recorded?**	**Yes** REFER to Section 206-09 to continue diagnosis. **No** GO to AP2 .

AP2 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test AQ: The Indicator Does Not Operate Correctly Check Fuel Cap

Normal Operation

The check fuel cap indicator is an output signal that is controlled by the PCM. When the PCM determines that there is a failure in the vapor management system due to the fuel cap not sealing correctly. The PCM communicates the fuel cap status to the instrument cluster over the SCP network. The message center uses that information to display the check fuel cap message.

Possible Causes

- fuel cap not installed correctly
- instrument cluster

PINPOINT TEST AQ: THE INDICATOR DOES NOT OPERATE CORRECTLY CHECK FUEL CAP

Test Step	Result / Action to Take
AQ1 RETRIEVE AND RECORD DTCS FROM CONTINUOUS AND ON-DEMAND SELF-TESTS PCM	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: PCM Self-Test. • **Are any DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual to continue diagnosis. **No** GO to AQ2 .
AQ2 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

• **Is the concern still present?**	

Pinpoint Test AR: The Indicator Does Not Operate Correctly Electronic Throttle Control

Normal Operation

The electronic throttle control indicator is an output signal that is controlled by the PCM. The PCM communicates the electronic throttle control status to the instrument cluster over the SCP network. The message center uses that information to display the electronic throttle control message.

Possible Causes

- electronic throttle control system
- instrument cluster

PINPOINT TEST AR: THE INDICATOR DOES NOT OPERATE CORRECTLY ELECTRONIC THROTTLE CONTROL

Test Step	Result / Action to Take
AR1 RETRIEVE AND RECORD DTCS FROM CONTINUOUS AND ON-DEMAND SELF-TESTS PCM	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: PCM Self-Test. • **Are any DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual to continue diagnosis. **No** GO to AR2 .
AR2 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Pinpoint Test AS: The Indicator Does Not Operate Correctly Parking Brake

Normal Operation

The park brake indicator is an output signal that is controlled by the electronic parking brake module. The electronic parking brake module communicates the parking brake status to the instrument cluster over the SCP network. The message center uses that information to display the parking brake message.

Possible Causes

- electronic parking brake system

- instrument cluster

PINPOINT TEST AS: THE INDICATOR DOES NOT OPERATE CORRECTLY PARKING BRAKE

Test Step	Result / Action to Take
AS1 RETRIEVE AND RECORD DTCS FROM CONTINUOUS AND ON-DEMAND SELF-TESTS ELECTRONIC PARKING BRAKE MODULE	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Electronic Parking Brake Module Self-Test. • **Are any DTCs recorded?**	**Yes** REFER to Section 206-00 to continue diagnosis. **No** GO to AS2 .
AS2 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

Warning Devices

Printable View (97 KB)

Refer to Wiring Diagrams Cell 66 , for schematic and connector information.

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2332-A	Worldwide Diagnostic System (WDS) 418 F224, New Generation STAR (NGS) Tester 418-F052 or equivalent diagnostic tool with the appropriate adaptor cable

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Door ajar switches • Key-in-ignition switch • Headlamp switch	• Central junction box (CJB) fuses: ♦ 4 (5A) ♦ 5 (10A) ♦ 13 (5A) ♦ 17 (5A) ♦ 20 (10A) • Battery junction box (BJB) fuses: ♦ 15 (40A) ♦ 22 (20A) ♦ 25 (40A) • Circuitry. • Instrument cluster.

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, connect the diagnostic tool to the data link connector and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
    - check that the program card is correctly installed.
    - check the connections to the vehicle.
    - check the ignition switch position.

5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

6. Carry out the diagnostic tool data link test. If the diagnostic tool responds with:
    - SCP+ or SCP- circuit fault; all electronic control units no response/not equipped, refer to Section 418-00 .
    - No response/not equipped for the instrument cluster, Go To Pinpoint Test F .
    - No response/not equipped for the electronic parking brake module, Section 206-00 .
    - No response/not equipped for the RCM, REFER to Section 501-20B .
    - System passed, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out the self-test diagnostics for the instrument cluster.

7. If the DTCs retrieved from the RCM are related to the concern, refer to Section 501-20B . If the DTCs retrieved from the instrument cluster are related to the concern, go to the Instrument Cluster Diagnostic Trouble Code (DTC) Index.

8. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

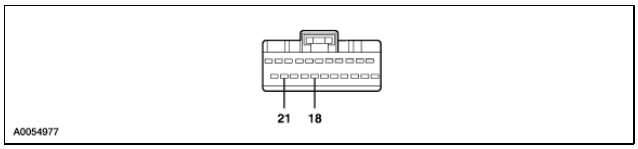
Instrument Cluster Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1352	Ignition Key-In Circuit Failure	Instrument Cluster	Go To Pinpoint Test AT .
B1342	ECU Defective	Instrument Cluster	CLEAR and DOCUMENT the DTCs. CARRY OUT the instrument cluster self-test. INSTALL a new instrument cluster if the DTC B1342 is retrieved again. REFER to Instrument Cluster in this section.
B1676	Battery Voltage Out of Range	Instrument Cluster	REPAIR the charging system. REFER to Section 414-00 .
B2477	Module Configuration Failure	Instrument Cluster	REPAIR the module configuration. REFER to Section 418-00 .

NOTE: For a complete master list of all instrument cluster DTCs refer to Section 418-00 .

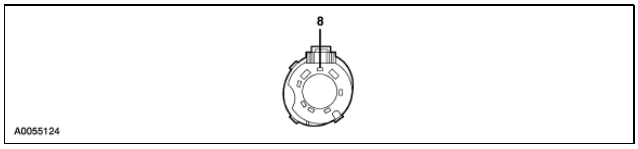
Symptom Chart
Connector Circuit Reference

Instrument Cluster C220a



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
18	Circuit 8-GE52 (WH/BK) safety belt switch input circuit from the restraint control module (RCM).	Less than 5 ohms between the instrument cluster and the RCM. Greater than 10,000 ohms between the instrument cluster and ground.
21	Circuit 30S-GM7 (RD/WH) key-in-ignition switch input circuit	Greater than 10 volts with the key in the ignition switch. 0 volts without the key in the ignition switch. Greater than 10,000 ohms between the key-in-ignition warning switch input circuit and ground.

Ignition Switch C250



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
8	Circuit 30S-GM7 (RD/WH) key-in-ignition switch input circuit	Greater than 10 volts with the key in the ignition switch. 0 volts without the key in the ignition switch. Greater than 10,000 ohms between the key-in-ignition warning switch input circuit and ground.

Pinpoint Test AT: The Key-In-Ignition Chime Does Not Operate Correctly

Normal Operation

When the key is inserted into the ignition key cylinder, the key-in-ignition switch (part of the ignition switch) closes circuit 30S-GM7 (RD/WH) to the instrument cluster. The 12 volt input signals the instrument cluster that the key is inserted. If the instrument cluster detects that the key is in the OFF or ACC position with the key inserted in the ignition key cylinder and the drivers door is ajar, the key-in-ignition warning chime (located in the instrument cluster) will sound.

Possible Causes

- circuit 30S-GM7 (RD/WH) open or shorted to ground
- key-in-ignition warning switch (part of the ignition switch)
- instrument cluster
- door ajar switch

PINPOINT TEST AT: THE KEY-IN-IGNITION CHIME DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
AT1 CHECK INTERIOR DOME LAMP	
• Open the driver door. • **Does the interior dome lamp illuminate when the driver door is open?**	**Yes** GO to AT2 . **No** REPAIR the interior dome lamp. REFER to Section 417-02 .
AT2 CHECK KEY-IN-IGNITION CHIME OPERATION	
• Open the driver door. • Insert the ignition key into the ignition switch in the OFF position with the driver door open. • **Does the chime sound?**	**Yes** The system is operating correctly at this time. **No** GO to AT3 .
AT3 MONITOR THE INSTRUMENT CLUSTER KEY-IN-IGNITION PID	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster PID. • Monitor the instrument cluster key-in-ignition PID • With the key in the ignition, the instrument cluster key-in-ignition PID should indicate yes. • **Does the instrument cluster key-in-ignition PID indicate yes?**	**Yes** GO to AT6 . **No** GO to AT4 .
AT4 CHECK CIRCUIT 30S-GM7 (RD/WH) FOR VOLTAGE	
• Remove the ignition key from the ignition switch. • Disconnect: Instrument Cluster C220a. • Insert the ignition key into the ignition switch. • Measure the voltage between the instrument cluster C220a-21, circuit 30S-GM7 (RD/WH), harness side and ground.  A0003915 • **Is the voltage greater than 10 volts?**	**Yes** GO to AT6 . **No** GO to AT5 .
AT5 CHECK CIRCUIT 30S-GM7 (RD/WH) FOR OPEN	

• Remove the ignition key from the ignition switch. • Disconnect: Ignition Switch C250. • Measure the resistance between the instrument cluster C220a-21, circuit 30S-GM7 (RD/WH), harness side and the ignition switch C250-8 , circuit 30S-GM7 (RD/WH), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new ignition switch. REFER to Section 211-00 . CLEAR the DTCs. TEST the system for normal operation. **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.
AT6 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test AU: The Headlamp On Reminder Chime Does Not Operate Correctly

Normal Operation

The headlamp on warning chime will sound when the driver door is opened, with the key in the OFF position and the key out, and the instrument cluster detects the headlamps are on. The autolamps must be turned OFF for the headlamp on reminder chime to operate.

Possible Causes

- instrument cluster
- door ajar switch

PINPOINT TEST AU: THE HEADLAMP ON REMINDER CHIME DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
AU1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TESTS INSTRUMENT CLUSTER	
• Use the recorded instrument cluster DTCs from the continuous and on-demand self-tests.	**Yes** REFER to Section 418-00 to continue diagnosis. **No**

• **Are any DTCs recorded?**	GO to AU2 .
AU2 CHECK THE INTERIOR DOME LAMP	
• Open the driver door. • **Does the interior dome lamp illuminate when the driver door is open?**	**Yes** GO to AU3 . **No** REPAIR the interior dome lamp. REFER to Section 417-02 .
AU3 CHECK THE AUTOLAMPS	
• Turn the autolamps OFF. • Turn the parking lamps ON. • Open the driver door. • **Does the headlamps on reminder chime sound?**	**Yes** The system is operating correctly at this time. **No** GO to AU4 .
AU4 CHECK THE EXTERIOR LAMPS	
• Turn the parking lamps ON. • Turn the headlamps ON. • **Do the exterior lamps operate correctly?**	**Yes** GO to AU5 . **No** REPAIR the exterior lamps. REFER to Section 417-01 .
AU5 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test AV: The Safety Belt Warning Chime Does Not Operate Correctly

Normal Operation

The instrument cluster receives the safety belt warning chime input from the restraint control module (RCM) through circuit 8-GE52 (WH/BK). When the key is in the RUN position, the instrument cluster sounds the safety belt warning chime when it detects a ground at circuit 8-GE52 (WH/BK).

Possible Causes

- circuit 8-GE52 (WH/BK) open or shorted to ground
- instrument cluster
- safety belt switch
- restraint control module (RCM)

PINPOINT TEST AV: THE SAFETY BELT WARNING CHIME DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
AV1 RETRIEVE THE DIAGNOSTIC TROUBLE CODES (DTCS)	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Restraint Control Module (RCM) Self-Test. • **Are any DTCs recorded?**	**Yes** REFER to Section 501-20B to continue diagnosis. **No** GO to AV2 .
AV2 CHECK CIRCUIT 8-GE52 (WH/BK) FOR OPEN OR SHORT TO GROUND	
• Key in OFF position. • Disconnect: Instrument Cluster C220a. • Key in ON position. • Measure the resistance between the instrument cluster C220a-18, circuit 8-GE52 (WH/BK), harness side and ground.  • Buckle both front safety belts. • Measure the resistance between the instrument cluster C220a-18, circuit 8-GE52 (WH/BK), harness side and ground.  • **Is the resistance less than 5 ohms with both front safety belts unbuckled, and is the resistance greater than 10,000 ohms with both front safety belts buckled?**	**Yes** GO to AV3 . **No** REPAIR the circuit. REFER to Section 501-20B for cautions and warnings before repairing the circuit. TEST the system for normal operation.
AV3 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time.

• Operate the system and verify the concern is still present. • **Is the concern still present?**	Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test AW: The Air Bag Warning Chime Does Not Operate Correctly

Normal Operation

The instrument cluster receives the air bag warning chime input from the restraint control module (RCM) through circuit 8-GE52 (WH/BK). The instrument cluster sounds the air bag warning chime when it detects a pulse width modulation (PWM) to ground from the RCM on circuit 8-GE52 (WH/BK).

Possible Causes

- instrument cluster
- restraint control module (RCM)

PINPOINT TEST AW: THE AIR BAG WARNING CHIME DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
AW1 RETRIEVE THE DIAGNOSTIC TROUBLE CODES (DTCS)	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Restraint Control Module (RCM) Self-Test. • **Are any DTCs recorded?**	**Yes** REFER to Section 501-20B to continue diagnosis. **No** GO to AW2 .
AW2 CHECK SAFETY BELT WARNING INDICATOR OPERATION	
• Key in OFF position. • Buckle both front safety belts. • Key in ON position. • Monitor the safety belt warning indicator operation. • **Does the safety belt warning indicator illuminate for approximately six seconds then turn off?**	**Yes** GO to AW3 . **No** Go To Pinpoint Test AV .
AW3 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

• Operate the system and verify the concern is still present. • **Is the concern still present?**	

Pinpoint Test AX: The Fail Safe Cooling Chime Does Not Operate Correctly

Normal Operation

The PCM communicates the fail safe cooling status to the instrument cluster over the SCP network.

Possible Causes

- instrument cluster
- PCM

PINPOINT TEST AX: THE FAIL SAFE COOLING CHIME DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
AX1 RETRIEVE THE DIAGNOSTIC TROUBLE CODES (DTCS)	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: PCM Self-Test. • **Are there any DTCs recorded?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual to continue diagnosis. **No** GO to AX2 .
AX2 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test AY: The Turn Signal Warning Chime Does Not Operate Correctly

Normal Operation

The instrument cluster sounds the turn signal warning chime when the turn signals have been activated for a distance greater than 0.5 miles.

Possible Causes

- instrument cluster

PINPOINT TEST AY: THE TURN SIGNAL WARNING CHIME DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
AY1 RETRIEVE THE DIAGNOSTIC TROUBLE CODES (DTCS)	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Self-Test. • **Are any DTCs recorded?**	**Yes** REFER to Section 418-00 to continue diagnosis. **No** GO to AY2 .
AY2 CHECK THE OPERATION OF THE TURN SIGNALS	
• Key in ON position. • Operate the turn signals. • Turn the steering wheel in both directions, with the turn signals activated, to check the turn signal canceling function. • **Do the turn signals operate correctly?**	**Yes** GO to AY3 **No** REPAIR the turn signals. REFER to Section 417-01 .
AY3 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test AZ: The Electronic Parking Brake Warning Chime Does Not Operate Correctly

Normal Operation

The instrument cluster momentarily sounds the electronic parking brake warning chime when the parking brake is applied and again when the parking brake is released. The electronic parking brake module communicates the parking brake status to the instrument cluster over the SCP network.

Possible Causes

- instrument cluster
- electronic parking brake system.

PINPOINT TEST AZ: THE ELECTRONIC PARKING BRAKE WARNING CHIME DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
AZ1 RETRIEVE THE DIAGNOSTIC TROUBLE CODES (DTCS)	
• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Electronic Parking Brake Module Self-Test. • **Are any DTCs recorded?**	**Yes** REFER to Section 206-00 to continue diagnosis. **No** GO to AZ2 .
AZ2 CHECK THE OPERATION OF THE ELECTRONIC PARKING BRAKE CHIME	
• Apply the parking brake. • Release the parking brake. • **Does the electronic parking brake chime sound when the parking brake is applied and again when the parking brake is released?**	**Yes** The system is operating correctly at this time. **No** GO to AZ3 .
AZ3 CHECK THE OPERATION OF THE ELECTRONIC PARKING BRAKE	
• Enter the following diagnostic mode on the diagnostic tool: Electronic Parking brake PIDs. • Monitor the parking brake switch PIDs. • Apply the parking brake. • Release the parking brake. • **Do the parking brake switch PIDs agree with the switch positions?**	**Yes** GO to AZ4 **No** REPAIR the electronic parking brake. REFER to Section 206-00 .
AZ4 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test BA: The Chime Sounds When The Driver Door Is Ajar (No Key In Ignition And Headlamps Off)

Normal Operation

The instrument cluster sounds the warning chime when the driver door is open and the key is in the OFF position or the headlamps are left on.

Possible Causes

- circuit 30S-GM7 (RD/WH) shorted to power
- key-in-ignition switch
- instrument cluster

PINPOINT TEST BA: THE CHIME SOUNDS WHEN THE DRIVER DOOR IS AJAR (NO KEY IN IGNITION AND HEADLAMPS OFF)

Test Step	Result / Action to Take
BA1 CHECK CIRCUIT 30S-GM7 (RD/WH) FOR A SHORT TO VOLTAGE	
• Disconnect: Instrument Cluster C220a. • Measure the voltage between the instrument cluster C220a-21, circuit 30S-GM7 (RD/WH), harness side and ground.  • **Is any voltage present?**	**Yes** GO to BA2 . **No** GO to BA3 .
BA2 CHECK KEY-IN-IGNITION SWITCH	
• Disconnect: Ignition Switch C250. • Measure the voltage between the instrument cluster C220a-21, circuit 30S-GM7 (RD/WH), harness side and ground.  • **Is any voltage indicated?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** INSTALL a new ignition switch. REFER to Section 211-00 . TEST the system for normal operation.
BA3 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	
• Disconnect all the instrument cluster connectors. • Check for: • corrosion	**Yes** INSTALL a new instrument cluster. REFER to Instrument Cluster in this section. TEST the system for normal operation.

• pushed-out pins • Connect all the instrument cluster connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Parking Aid Printable View (258 KB)

Refer to Wiring Diagrams Cell 131 for schematic and connector information.

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2332-A	Worldwide Diagnostic System (WDS) 418 F224, New Generation STAR (NGS) Tester 418-F052 or equivalent diagnostic tool with the appropriate adaptor cable

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of electrical damage.

   Visual Inspection Chart

Electrical
• Central junction box (CJB) fuse 29 (5A) • Circuitry • Parking aid module • Parking aid sensors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, connect the diagnostic tool to the data link connector and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
   - check that the program card is correctly installed.
   - check the connections to the vehicle.
   - check the ignition switch position.
5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.
6. Carry out the diagnostic tool data link test. If the diagnostic tool responds with:
   - SCP+ or SCP- circuit fault; all electronic control units no response/not equipped, refer to Section 418-00 .

- No response/not equipped for the parking aid module, Go To Pinpoint Test BB .
- System passed, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out the self-test diagnostics for the instrument cluster.

7. If the DTCs retrieved are related to the concern, go to the Parking Aid Module Diagnostic Trouble Code (DTC) Index.

8. If no DTCs related to the concern are retrieved, GO to Symptom Chart to continue diagnostics.

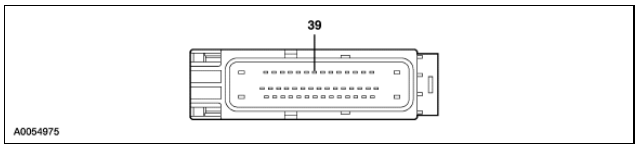
Parking Aid Module Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1299	Power Supply Sensor Circuit Short to Ground	Parking Aid Module	Go To Pinpoint Test BC .
B1342	ECU is Defective	Parking Aid Module	CLEAR the DTCs. REPEAT the parking aid module self-test. If DTC B1342 is retrieved again, INSTALL a new parking aid module. REFER to Parking Aid Module in this section. CLEAR all DTCs. REPEAT the self-test.
B1627	PRNDL Reverse Input Circuit Failure	Parking Aid Module	Go To Pinpoint Test BC .
B2844	Ignition Voltage Out Of Range	Parking Aid Module	Go To Pinpoint Test BC .
B2904	Partial Mute Circuit Failure	Parking Aid Module	Go To Pinpoint Test BC .
C1700	Left Rear Sensor Circuit Failure Or Blockage	Parking Aid Module	CLEAN the rear bumper and sensors with high-pressure water. CLEAR the DTCs. REPEAT the self-test. If the DTC returns, Go To Pinpoint Test BC .
C1703	Right Rear Sensor Circuit Failure Or Blockage	Parking Aid Module	CLEAN the rear bumper and sensors with high-pressure water. CLEAR the DTCs. REPEAT the self-test. If the DTC returns, Go To Pinpoint Test BC .
C1983	Radar Sensor Fault	Parking Aid Module	CLEAN the rear bumper and sensors with high-pressure water. CLEAR the DTCs. REPEAT the self-test. If the DTC returns, INSTALL a new parking aid radar sensor; REFER to Parking Aid Sensor in this section. CLEAR all DTCs.
C1984	Radar Sensor Circuit Failure	Parking Aid Module	Go To Pinpoint Test BC .
C1985	Parking Aid Switch Stuck Low	Parking Aid Module	Go To Pinpoint Test BC .
B1992	Vehicle Speed Circuit Failure	Parking Aid Module	Go To Pinpoint Test BC .

Symptom Chart

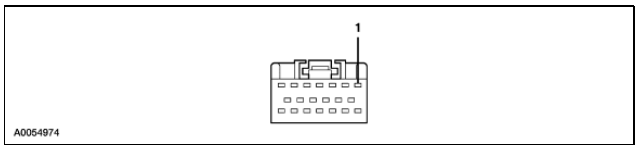
Symptom Chart
Connector Circuit Reference

Anti-lock Brake System (ABS) C155



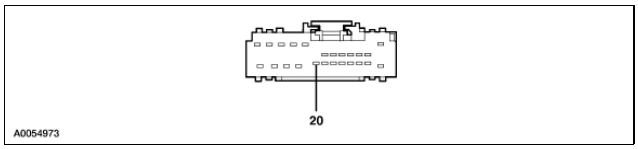
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
39	Circuit 8-GN14 (WH/BK) input circuit from ABS to the parking aid module.	5 ohms or less between parking aid module and ABS. 10,000 ohms or greater between parking aid module and ground.

Audio Unit C240c (CDX6)



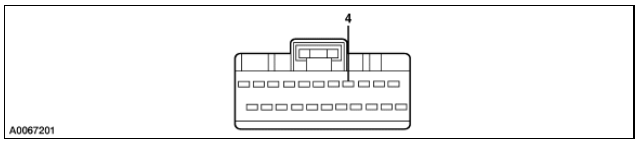
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	Circuit 8-GN17 (WH/RD) mute signal circuit to audio unit from parking aid module.	5 ohms or less between parking aid module and audio unit. 10,000 ohms or greater between parking aid module and ground.

Audio Unit C290b (DM100i) or C2253a (VNR)



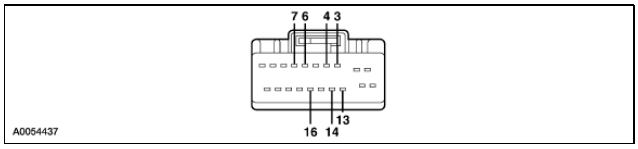
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
20	Circuit 8-GN17 (WH/RD) mute signal circuit to audio unit from parking aid module.	5 ohms or less between parking aid module and audio unit. 10,000 ohms or greater between parking aid module and ground.

Rear Electronic Module (REM) C420b



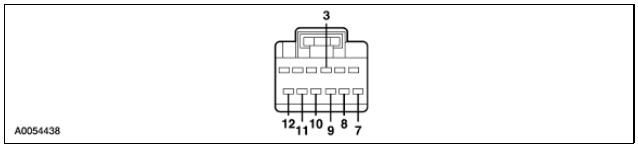
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
4	Circuit 8-GN11 (WH/RD) reverse output to the parking aid module.	10 volts or greater during key in ON position with reverse gear engaged.

Parking Aid Module C4014a



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
3	Circuit 9-GN1 (BN/RD) ground for the parking aid sensors.	5 ohms or less between parking aid module and sensor. 5 ohms or less to ground. 0 volts at all times.
4	Circuit 31S-GN21 (BK/OG) ground for the parking aid sensor.	5 ohms or less between parking aid module and sensor. 5 ohms or less to ground. 0 volts at all times.
6	Circuit 8-GN20 (WH/RD) input from parking aid sensor.	5 ohms or less between parking aid module and sensor.
7	Circuit 8-GN19 (WH) input from parking aid sensor.	5 ohms or less between parking aid module and sensor.
13	Circuit 7-GN1 (YE) power to parking aid sensors.	10 volts or greater during key ON position with parking aid on. 10,000 ohms or greater with key OFF to ground.
14	Circuit 7-GN21 (YE/BU) power to parking aid sensor.	10 volts or greater during key ON position with parking aid on. 10,000 ohms or greater with key OFF to ground.
16	Circuit 8-GN21 (WH/BU) input from parking aid sensor.	5 ohms or less between parking aid module and sensor.

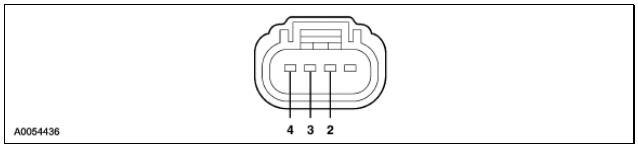
Parking Aid Module C4014b



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement

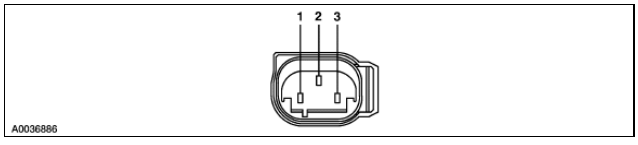
3	Circuit 8-GN17 (WH/RD) mute signal from the parking aid module to the radio.	5 ohms or less between the parking aid module and the radio.
7	Circuit 91-GN10 (BN) parking aid module ground.	5 ohms or less to ground. 0 volts at all times.
8	Circuit 8-GN14 (WH/BK) vehicle speed input.	5 ohms or less between the parking aid module and the anti-lock brake system (ABS) module.
9	Circuit 8-GN12 (WH/BU), parking aid enable/disable input from the parking aid switch.	5 ohms or less between parking aid module and parking aid switch.
10	Circuit 7-GN23 (YE/BK) signal circuit to the parking aid disabled lamp.	5 ohms or less between parking aid module and parking aid disable switch.
11	Circuit 8-GN11 (WH/RD) reverse input to the parking aid module.	10 volts or greater during key in ON position with reverse gear engaged.
12	Circuit 20-GN10 (PK/YE) B+ power feed, not in the START/RUN position.	10 volts or greater in START/RUN, less than 5 ohms resistance between the parking aid module and the central junction box (CJB), greater than 10,000 ohms between the parking aid module and ground.

Parking Aid Sensor C4191



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
2	Circuit 8-GN21 (WH/BU) signal circuit to parking aid module from parking aid sensor.	5 ohms or less between parking aid sensor and parking aid module.
3	Circuit 31S-GN21 (BK/OG) parking aid sensor ground through parking aid module.	5 ohms or less to ground. 0 volts at all times.
4	Circuit 7-GN21 (YE/BU) parking aid sensor power from the parking aid module.	10 volts or greater with key in ON position and parking aid on.

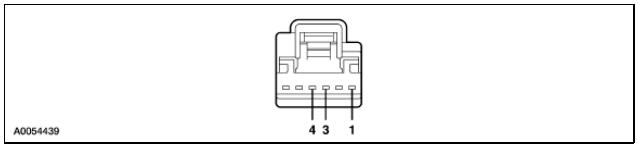
Parking Aid Sensor C4192 and C4193



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1 (C4192)	Circuit 8-GN20 (WH/RD) signal circuit to parking aid module from parking aid sensor.	5 ohms or less between parking aid sensor and parking aid module.
1 (C4193)		

	Circuit 8-GN19 (WH) signal circuit to parking aid module from parking aid sensor.	5 ohms or less between parking aid sensor and parking aid module.
2 (C4192)	Circuit 9-GN20 (BN/RD) parking aid sensor ground through parking aid module.	5 ohms or less to ground. 0 volts at all times.
2 (C4193)	Circuit 9-GN19 (BN) parking aid sensor ground through parking aid module.	5 ohms or less to ground. 0 volts at all times.
3 (C4192)	Circuit 7-GN20 (YE/RD) parking aid sensor power from the parking aid module.	10 volts or greater with key in ON position and parking aid on.
3 (C4193)	Circuit 7-GN19 (YE) parking aid sensor power from the parking aid module.	10 volts or greater with key in ON position and parking aid on.

Parking Aid Switch C9011



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	Circuit 7-GN23 (YE/BK) signal circuit to parking aid indicator from parking aid module.	5 ohms or less between parking aid module and parking aid switch.
3	Circuit 31-GN12 (BK/OG) ground circuit.	5 ohms or less between parking aid switch and ground.
4	Circuit 8-GN12 (WH/BU) parking aid enable/disable input from parking aid switch to parking aid module.	5 ohms or less between parking aid module and parking aid switch.

Pinpoint Test BB: No Communication With The Parking Aid Module

Normal Operation

The parking aid module communicates to the diagnostic tool through circuit 4-GN10 (GY). Power is supplied to the parking aid module on circuit 20-GN10 (PK/YE). The parking aid module is grounded through circuit 91-GN10 (BN).

Possible Causes

- parking aid module
- circuit 20-GN10 (PK/YE) open
- circuit 91-GN10 (BN) open
- circuit 4-GN10 (GY) open

PINPOINT TEST BB: NO COMMUNICATION WITH THE PARKING AID MODULE

Test Step	Result / Action to Take
⚠ CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.	

BB1 CHECK CIRCUIT 20-GN10 (PK/YE) FOR VOLTAGE	
• Key in OFF position. • Disconnect: Parking Aid Module C4014b. • Key in ON position. • Measure the voltage between the parking aid module C4014b-12, circuit 20-GN10 (PK/YE), harness side and ground.  A0061008 • **Is the voltage greater than 10 volts?**	**Yes** GO to BB2 . **No** REPAIR the circuit. TEST the system for normal operation.
BB2 CHECK CIRCUIT 91-GN10 (BN) FOR OPEN	
• Key in OFF position. • Measure the resistance between the parking aid module C4014b-7, circuit 91-GN10 (BN), harness side and ground.  A0061009 • **Is the resistance less than 5 ohms?**	**Yes** REFER to Section 418-00 . **No** REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test BC: The Parking Aid Is Inoperative

Normal Operation

The parking aid system is enabled when the vehicle key is in RUN position and REVERSE gear is selected. The parking aid module supplies power to the parking aid sensors on circuit 7-GN1 (YE) and circuit 7-GN21 (YE/BU). The parking aid module supplies ground to the parking aid sensors on circuit 9-GN1 (BN/RD) and circuit 31S-GN21 (BK/OG). The parking aid module receives a signal from the parking aid sensors on circuits 8-GN19 (WH), 8-GN20 (WH/RD) and 8-GN21 (WH/BU). The system can be enabled/disabled through the parking aid switch. The parking aid speaker is integral to the parking aid module. A 750 Hz variable warning tone is generated by the parking aid speaker. The parking aid speaker increases the warning tone rate as the vehicle gets closer to an obstacle.

Possible Causes

- anti-lock brake system (ABS) module
- audio unit
- bumper
- parking aid switch
- parking aid sensor
- parking aid module
- parking aid speaker
- rear electronic module (REM)
- circuit 20-GN10 (PK/YE) open
- circuit 91-GN10 (BN) open

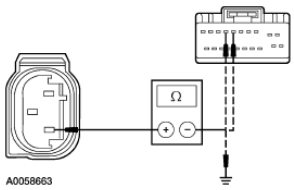
- circuit 8-GN12 (WH/BU) short to ground
- circuit 8-GN11 (WH/RD) open
- circuit 7-GN23 (YE/BK) open, shorted to ground or shorted to power
- circuit 7-GN1 (YE) open or shorted to ground
- circuit 7-GN21 (YE/BU) open or shorted to ground
- circuit 9-GN1 (BN/RD) open
- circuit 31S-GN21 (BK/OG) open
- circuit 8-GN19 (WH) open, shorted to ground or shorted to power
- circuit 8-GN20 (WH/RD) open, shorted to ground or shorted to power
- circuit 8-GN21 (WH/BU) open, shorted to ground or shorted to power
- circuit 8-GN17 (WH/RD) open
- circuit 8-GN14 (WH/BK) open

PINPOINT TEST BC: THE PARKING AID IS INOPERATIVE

Test Step	Result / Action to Take
⚠ CAUTION: Use the correct probe adapter(s) when making measurements. Failure to use the correct probe adapter(s) may damage the connector.	
BC1 CHECK THE RECORDED DTCS FROM THE PARKING AID MODULE SELF-TEST	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Parking Aid Module Self-Test. • **Are any DTCs recorded?**	**Yes** If DTC C1700 or C1703 GO to BC2 . If DTC C1984, GO to BC6 . If DTC B1299, GO to BC10 . If DTC B2844, GO to BC12 . If DTC C1985, GO to BC13 . If DTC B1627, GO to BC15 . If DTC B2904, GO to BC18 . If DTC C1992, GO to BC23 . **No** GO to BC26 .
BC2 CHECK POWER SUPPLY CIRCUIT	
• Disconnect the suspect parking aid sensor. • Key in ON position. • Measure the voltage between the (LH) parking aid sensor C4192-3, circuit 7-GN20 (YE/RD) , harness side and ground; or between the (RH) parking aid sensor C4193-3, circuit 7-GN19 (YE), harness side and ground.	**Yes** GO to BC4 . **No** GO to BC3 .

 A0061010 • **Is the voltage greater than 10 volts?**	
BC3 CHECK POWER SUPPLY CIRCUIT FOR OPEN	
• Key in OFF position. • Disconnect: Parking Aid Module C4014a. • Measure the resistance between the parking aid module C4014a-13, circuit 7-GN1 (YE), harness side and the suspect parking aid sensor C4192-3 (LH), circuit 7-GN20 (YE/RD) , harness side or C4193-3 (RH), circuit 7-GN19 (YE), harness side.  A0061011 • **Is the resistance less than 5 ohms?**	**Yes** GO to BC27 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
BC4 CHECK SIGNAL RETURN CIRCUIT FOR OPEN	
• Key in OFF position. • Disconnect: Parking Aid Module C4014a. • Measure the resistance between the parking aid module C4014a-3, circuit 9-GN1 (BN/RD), harness side and the suspect parking aid sensor C4192-2 (LH), circuit 9-GN20 (BN/RD), harness side or C4193-2 (RH), circuit 9-GN19 (BN), harness side.  A0061012 • **Is the resistance less than 5 ohms?**	**Yes** GO to BC5 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
BC5 CHECK SIGNAL CIRCUIT FOR OPEN OR SHORT TO GROUND	
• Measure the resistance between the suspect parking aid sensor and the parking aid module, harness side; and measure the resistance between the suspect parking aid sensor, harness side and ground.	**Yes** INSTALL a new parking aid sensor. REFER to Parking Aid Sensor in this section. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

Parking Aid Module	Parking Aid Sensor	Circuit
C4014a-7	C4193-1	8-GN19 (WH)
C4014a-6	C4192-1	8-GN20 (WH/RD)



- **Is the resistance less than 5 ohms between the parking aid sensor and the parking aid module and greater than 10,000 ohms between the parking aid sensor and ground?**

BC6 CHECK CIRCUIT 7-GN21 (YE/BU) FOR POWER	
• Disconnect: Parking Aid Sensor C4191. • Key in ON position. • Measure the voltage between the parking aid sensor C4191-4, circuit 7-GN21 (YE/BU) , harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to BC8 . **No** GO to BC7 .
BC7 CHECK CIRCUIT 7-GN21 (YE/BU) FOR OPEN	
• Key in OFF position. • Disconnect: Parking Aid Module C4014a. • Measure the resistance between the parking aid sensor C4191-4, circuit 7-GN21 (YE/BU), harness side and the parking aid module C4014a-14, circuit 7-GN21 (YE/BU), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to BC27 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
BC8 CHECK CIRCUIT 31S-GN21 (BK/OG) FOR OPEN	

• Key in OFF position. • Disconnect: Parking Aid Module C4014a. • Measure the resistance between the parking aid module C4014a-4, circuit 31S-GN21 (BK/OG), harness side and the parking aid sensor C4191-3, circuit 31S-GN21 (BK/OG), harness side.  A0061014 • **Is the resistance less than 5 ohms?**	**Yes** GO to BC9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
BC9 CHECK CIRCUIT 8-GN21 (WH/BU) FOR OPEN OR SHORT TO GROUND	
• Measure the resistance between the parking aid sensor C4191-2, circuit 8-GN21 (WH/BU), harness side and the parking aid module C4014a-16, circuit 8-GN21 (WH/BU), harness side; and measure the resistance between the parking aid sensor C4191-2, circuit 8-GN21 (WH/BU), harness side and ground.  A0061015 • **Is the resistance less than 5 ohms between the parking aid sensor and the parking aid module and greater than 10,000 ohms between the parking aid sensor and ground?**	**Yes** INSTALL a new parking aid sensor. REFER to Parking Aid Sensor in this section. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
BC10 CHECK POWER SUPPLY CIRCUIT FOR SHORT TO GROUND	
• Key in OFF position. • Disconnect: Parking Aid Module C4014a. • Measure the resistance between the parking aid module C4014a-13, circuit 7-GN1 (YE), harness side and ground; and measure the resistance between the parking aid module C4014a-14, circuit 7-GN21 (YE/BU), harness side and ground.  A0058666 • **Is each resistance between 0 and 5 ohms?**	**Yes** GO to BC11 . **No** GO to BC27 .

BC11 CHECK POWER SUPPLY CIRCUIT FOR SHORT TO GROUND IN PARKING AID SENSOR	
• Measure the resistance between the parking aid module C4014a-13, circuit 7-GN1 (YE), harness side and ground while disconnecting the LH and RH parking aid sensors.  A0061016 • Measure the resistance between the parking aid module C4014a-14, circuit 7-GN21 (YE/BU), harness side and ground while disconnecting the center parking aid sensor.  A0061017 • **Does the resistance change to greater than 5 ohms after disconnecting the suspect parking aid sensor(s)?**	**Yes** INSTALL the new parking aid sensor(s) in question. REFER to Parking Aid Sensor in this section. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
BC12 CHECK CIRCUIT 20-GN10 (PK/YE) FOR VOLTAGE	
• Key in OFF position. • Disconnect: Parking Aid Module C4014b. • Key in ON position. • Measure the voltage between the parking aid module C4014b-12, circuit 20-GN10 (PK/YE), harness side and ground.  A0061008 • **Is the voltage greater than 10 volts?**	**Yes** GO to BC27 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
BC13 CHECK CIRCUIT 8-GN12 (WH/BU) FOR SHORT	
• Key in OFF position. • Disconnect: Parking Aid Module C4014b. • Measure the resistance between the parking aid module C4014b-9, circuit 8-GN12 (WH/BU), harness side and ground.	**Yes** GO to BC27 . **No** GO to BC14 .

 A0061018 • **Is the resistance greater than 10,000 ohms?**	
BC14 CHECK CIRCUIT 8-GN12 (WH/BU) FOR SHORT TO GROUND	
• Disconnect: Parking Aid Switch C9011. • Measure the resistance between the parking aid module C4014b-9, circuit 8-GN12 (WH/BU), harness side and ground.  A0061018 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new parking aid switch. REFER to Parking Aid Switch in this section. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
BC15 CHECK REVERSE LAMPS OPERATION	
• Key in ON position. • Place the transmission in REVERSE. • Check the reverse lamps operation. • **Do the reverse lamps illuminate?**	**Yes** GO to BC16 . **No** REFER to Section 417-01 .
BC16 CHECK CIRCUIT 8-GN11 (WH/RD) FOR VOLTAGE	
• Key in OFF position. • Disconnect: Parking Aid Module C4014b. • Key in ON position. • Place the transmission in REVERSE. • Measure the voltage between the parking aid module C4014b-11, circuit 8-GN11 (WH/RD), harness side and ground.  A0061019 • **Is the voltage greater than 10 volts?**	**Yes** GO to BC27 . **No** GO to BC17 .
BC17 CHECK CIRCUIT 8-GN11 (WH/RD) FOR OPEN	
• Key in OFF position. • Disconnect: REM C420b. • Measure the resistance between the parking aid module C4014b-11, circuit 8-GN11 (WH/RD), harness side and the REM C420b-4, circuit 8-GN11 (WH/RD), harness side.	**Yes** GO to BC28 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 • **Is the resistance less than 5 ohms?**	
BC18 CHECK CIRCUIT 8-GN17 (WH/RD) FOR SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Parking Aid Module C4014b. • Key in ON position. • Measure the voltage between the parking aid module C4014b-3, circuit 8-GN17 (WH/RD), harness side and ground.  • **Is any voltage indicated?**	**Yes** GO to BC19 . **No** GO to BC20 .
BC19 CHECK CIRCUIT 8-GN17 (WH/RD) FOR SHORT TO VOLTAGE IN AUDIO UNIT	
• Key in OFF position. • Disconnect: Audio Unit C290b (DM100i) or C240c (CDX6) or C2253a (VNR). • Key in ON position. • Measure the voltage between the parking aid module C4014b-3, circuit 8-GN17 (WH/RD), harness side and ground.  • **Is any voltage indicated?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. REFER to Section 415-00 . CLEAR the DTCs. TEST the system for normal operation.
BC20 CHECK CIRCUIT 8-GN17 (WH/RD) FOR SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between the parking aid module C4014b-3, circuit 8-GN17 (WH/RD), harness side and ground.	**Yes** GO to BC22 . **No** GO to BC21 .

 A0061022 • **Is the resistance greater than 10,000 ohms?**	
BC21 CHECK CIRCUIT 8-GN17 (WH/RD) FOR SHORT TO GROUND IN RADIO	
• Disconnect: Audio Unit C290b (DM100i) or C240c (CDX6) or C2253a (VNR). • Measure the resistance between the parking aid module C4014b-3, circuit 8-GN17 (WH/RD), harness side and ground.  A0061022 • **Is the resistance greater than 10,000 ohms?**	**Yes** REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. REFER to Section 415-00 . CLEAR the DTCs. TEST the system for normal operation. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
BC22 CHECK CIRCUIT 8-GN17 (WH/RD) FOR OPEN	
• Disconnect: Audio Unit C290b (DM100i) or C240c (CDX6) or C2253a (VNR). • Measure the resistance between the parking aid module C4014b-3, circuit 8-GN17 (WH/RD), harness side and the audio unit connector, harness side. **Connector and Pin / Circuit** C290b-20 (DM100i) / 8-GN17 (WH/RD) C240c-1 (CDX6) / 8-GN17 (WH/RD) C2253a-20 (VNR) / 8-GN17 (WH/RD)  A0067203 • **Is the resistance less than 5 ohms?**	**Yes** GO to BC27 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
BC23 CHECK CIRCUIT 8-GN14 (WH/BK) FOR SHORT TO GROUND	

• Key in OFF position. • Disconnect: Parking Aid Module C4014b. • Measure the resistance between the parking aid module C4014b-8, circuit 8-GN14 (WH/BK), harness side and ground.  A0061024 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to BC25 . **No** GO to BC24 .
BC24 CHECK CIRCUIT 8-GN14 (WH/BK) FOR SHORT TO GROUND IN ABS MODULE	
• Disconnect: ABS C155. • Measure the resistance between the parking aid module C4014b-8, circuit 8-GN14 (WH/BK), harness side and ground.  A0067204 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new ABS module. REFER to Section 206-09 . CLEAR the DTCs. TEST the system for normal operation. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
BC25 CHECK CIRCUIT 8-GN14 (WH/BK) FOR OPEN	
• Disconnect: ABS C155. • Measure the resistance between the parking aid module C4014b-8, circuit 8-GN14 (WH/BK), harness side and the ABS C155-39 with stability assist or C155-6 without stability assist, circuit 8-GN14 (WH/BK), harness side.  A0067205 • **Is the resistance less than 5 ohms?**	**Yes** GO to BC27 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
BC26 CHECK PARKING AID MODULE SENSORS FOR CORRECT ALIGNMENT	
NOTE: If the vehicle has been in an accident, the parking aid module sensors may not be aligned correctly. • Check the bumper for correct alignment, refer to Elevation System Check in this section. • Check the parking aid sensor(s) and bezel(s) for correct adjustment. Refer to Azimuth System Check (Minimum	**Yes** GO to BC27 . **No** INSTALL a new bumper. REFER to Section 501-00 . If the vehicle has been in an accident, further

Detectable Object Verification) in this section. • **Are the bumper and parking aid sensors correctly aligned?**	body work may be required to bring the parking aid sensors into correct alignment.
BC27 CHECK FOR CORRECT PARKING AID MODULE OPERATION	

• Disconnect all the parking aid module connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the parking aid module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new parking aid module. REFER to Parking Aid Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

BC28 CHECK FOR CORRECT REM OPERATION	

• Disconnect all the REM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the REM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new REM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test BD: The Parking Aid Is Inoperative Disabled Indicator Is Always On/Never On

Normal Operation

The parking aid module illuminates the disabled indicator by supplying the power on circuit 7-GN23 (YE/BK). The parking aid switch disabled indicator is grounded through circuit 31-GN12 (BK/OG).

Possible Causes

- parking aid module
- parking aid switch
- circuit 7-GN23 (YE/BK) open or shorted
- circuit 31-GN12 (BK/OG) open
- circuit 8-GN12 (WH/BU) open

PINPOINT TEST BD: THE PARKING AID IS INOPERATIVE DISABLED INDICATOR IS ALWAYS ON/NEVER ON

Test Step	Result / Action to Take
BD1 CHECK THE RECORDED DTCS FROM PARKING AID MODULE SELF-TEST	
• Key in OFF position.	**Yes** Go To Pinpoint Test BC to continue

• Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Parking Aid Module Self-Test. • **Are any DTCs recorded?**	diagnosis. **No** GO to BD2 .
BD2 CHECK PARKING AID INDICATOR OPERATION	
• Key in ON position. • Place the transmission in REVERSE. • Monitor the parking aid indicator while pressing the parking aid switch. • Press the parking aid switch to disable the parking aid system. • Press the parking aid switch to enable the parking aid system. • **Is the indicator on after pressing the switch to disable the system and is the indicator off after pressing the switch to enable the system?**	**Yes** The system is operating correctly at this time. **No** GO to BD3 .
BD3 CHECK CIRCUIT 7-GN23 (YE/BK) FOR SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Parking Aid Switch C9011. • Key in ON position. • Measure the voltage between the parking aid switch C9011-1, circuit 7-GN23 (YE/BK), harness side and ground.  A0061026 • **Is the voltage greater than 10 volts?**	**Yes** GO to BD4 . **No** GO to BD5 .
BD4 CHECK CIRCUIT 7-GN23 (YE/BK) FOR SHORT TO VOLTAGE IN MODULE	
• Key in OFF position. • Disconnect: Parking Aid Module C4014b. • Key in ON position. • Measure the voltage between the parking aid switch C9011-1, circuit 7-GN23 (YE/BK), harness side and ground.  A0061026 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to BD10 .

BD5 CHECK CIRCUIT 7-GN23 (YE/BK) FOR SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between the parking aid switch C9011-1, circuit 7-GN23 (YE/BK), harness side and ground.  A0061027 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to BD7 . **No** GO to BD6 .
BD6 CHECK CIRCUIT 7-GN23 (YE/BK) FOR SHORT TO GROUND IN MODULE	
• Disconnect: Parking Aid Module C4014b. • Measure the resistance between the parking aid switch C9011-1, circuit 7-GN23 (YE/BK), harness side and ground.  A0061027 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to BD10 . **No** REPAIR the circuit. TEST the system for normal operation.
BD7 CHECK CIRCUIT 31-GN12 (BK/OG) FOR OPEN	
• Measure the resistance between the parking aid switch C9011-3, circuit 31-GN12 (BK/OG), harness side and ground.  A0061028 • **Is the resistance less than 5 ohms?**	**Yes** GO to BD8 . **No** REPAIR the circuit. TEST the system for normal operation.
BD8 CHECK CIRCUIT 8-GN12 (WH/BU) FOR OPEN	
• Disconnect: Parking Aid Module C4014b. • Measure the resistance between the parking aid switch C9011-4, circuit 8-GN12 (WH/BU), harness side and the parking aid module C4014b-9, circuit 8-GN12 (WH/BU), harness side.	**Yes** GO to BD9 . **No** REPAIR the circuit. TEST the system for normal operation.

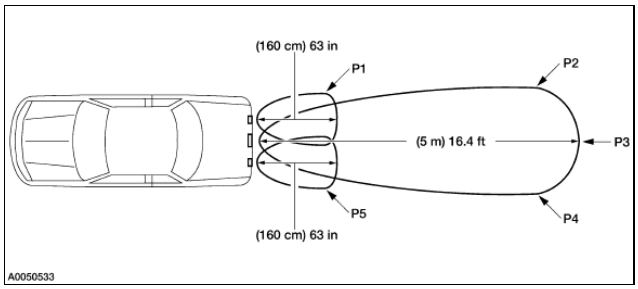
 A0061761 • **Is the resistance less than 5 ohms?**	
BD9 CHECK CIRCUIT 7-GN23 (YE/BK) FOR OPEN	
• Disconnect: Parking Aid Module C4014b. • Measure the resistance between the parking aid switch C9011-1, circuit 7-GN23 (YE/BK), harness side and the parking aid module C4014b-10, circuit 7-GN23 (YE/BK), harness side.  A0061029 • **Is the resistance less than 5 ohms?**	**Yes** GO to BD10 . **No** REPAIR the circuit. TEST the system for normal operation.
BD10 CHECK PARKING AID SWITCH	
• Measure the resistance between the parking aid switch C9011-1, component side and C9011-3, component side.  A0061030 • **Is the resistance less than 10,000 ohms?**	**Yes** GO to BD11 . **No** INSTALL a new parking aid switch. REFER to Parking Aid Switch in this section. TEST the system for normal operation.
BD11 CHECK FOR CORRECT PARKING AID MODULE OPERATION	

• Disconnect all the parking aid module connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the parking aid module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new parking aid module. REFER to Parking Aid Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Azimuth System Check

Printable View (28 KB)

Maximum Detectable Object Locations



1. **NOTE:** The object used in this system check can be fabricated from 7.62 cm (3 in) in diameter plastic pipe 99.06 cm (39 in) length (available as PVC pipe, or similar from a hardware or plumbing supply).

   NOTE: The following system check should be carried out with the vehicle on a level surface.

   NOTE: The parking aid system will default to on when the ignition key is cycled from OFF to ON.

   Key in ON position, engine OFF.

2. Set the parking brake on.

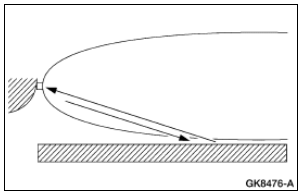
3. Place the transmission in REVERSE.

4. Verify that the parking aid system detects the specified object when placed within the five specified locations (P1, P2, P3, P4, P5). These zones are shown ideally and are not absolute. Pipe should be inside of locations.

Elevation System Check

Printable View (15 KB)

1. Check the ground reflection verification and sensor coverage pattern.



2. The parking aid system must be checked to make sure that the system does not see signals from ground reflections.

3. The following system check should be carried out with the vehicle on a 3.0 meters wide by 4.5 meters deep (15 feet wide by 10 feet deep) smooth concrete surface, free of all obstacles and noise from fan and pneumatic tools.

4. Turn the ignition to the ON position, engine OFF.

5. Set the parking brake on.

6. Place the transmission selector lever in REVERSE.

7. **NOTE:** No audible alerts should be heard. If audible alerts are heard, check to make sure the bumper is correctly installed and is not tilted downward so that the sensor is pointing at the ground.

   Verify that no audible alerts are heard.

Belt Minder Deactivating/Activating

Printable View (8 KB)

Preparation

1. Before deactivating/activating the belt minder, set the parking brake.
2. Place an automatic transmission PARK or a manual transmission in NEUTRAL position.
3. Key in OFF position.
4. Close all the vehicle doors.
5. Unbuckle the driver safety belt.
6. Place the parking lamps/headlamps switch in the OFF position.

Deactivating/Activating

1. Start with the ignition OFF and the driver and passenger safety belts unbuckled.
2. Turn the ignition to RUN (it is not required to start the vehicle.)
3. Wait until the safety belt warning lamp turns off (approximately one minute.)
4. Buckle then unbuckle the driver or passenger safety belt three times, ending in the unbuckled state.
5. Turn the headlamps ON then OFF.
6. Buckle then unbuckle the driver or passenger safety belt three times, ending in the unbuckled state. Steps 4 through 6 must be completed within 60 seconds.
7. After Step 6 is complete the safety belt warning lamp will be turned on for three seconds.
8. After the safety belt warning lamp turns off, buckle, then unbuckle the safety belt again. This step must be completed within 10 seconds. This will enable the beltminder if it is currently disabled, or will disable the beltminder if it is currently enabled.
9. Confirmation of enabling the beltminder is provided to the customer by the safety belt warning lamp flashing four times per second for three seconds, followed by flashing four times per second for three seconds again.
10. Confirmation of disabling the beltminder is provided to the customer by the safety belt warning lamp flashing four times per second for three seconds.
11. Customer programming of the beltminder is automatically exited after completion of the customer confirmation.
12. The beltminder will automatically exit the programming mode without changing its enable status if Step 8 does not occur within 10 seconds of the end of Step 6.

13. Performing Steps 1-12 using only the driver safety belt will permanently enable/ disable the driver beltminder feature.

14. Performing Steps 1-12 using only the passenger safety belt will permanently enable/disable the passenger beltminder feature.

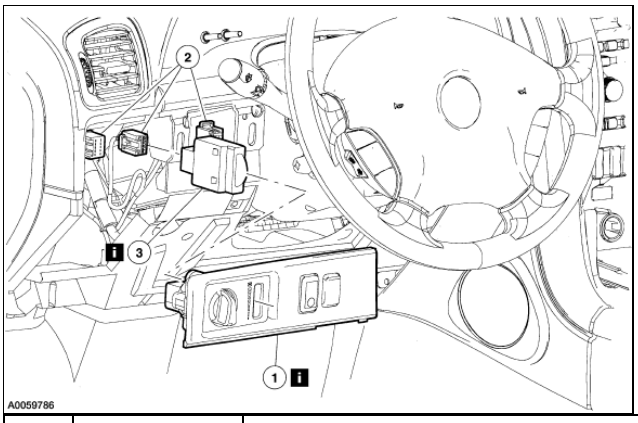
15. Only one side (driver or passenger) can be enabled/disabled per key cycle. While programming the driver side, any activity on the passenger safety belt will abort the programming sequence. While programming the passenger side, any activity on the driver safety belt will terminate the programming sequence.

16. The programming sequence will abort if a system fault occurs that requires the illumination of the safety belt warning lamp at any time during programming or confirmation.

Instrument Cluster and Panel Illumination Printable View (126 KB)

1. Remove the instrument panel steering column cover. For additional information, refer to Section 501-01 .

2. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1	044B89	Outer instrument panel finish panel Removal Note
2	14401	Headlamp switch and dimmer switch electrical connectors
3	13K196	Dimmer switch Removal Note

3. To install, reverse the removal procedure.

Item 1: Outer Instrument Panel Finish Panel Removal Note

1. The outer instrument panel finish panel is held in place by spring clips located on the housing.

Item 3: Dimmer Switch Removal Note

1. Release the retaining tabs to remove the dimmer switch.

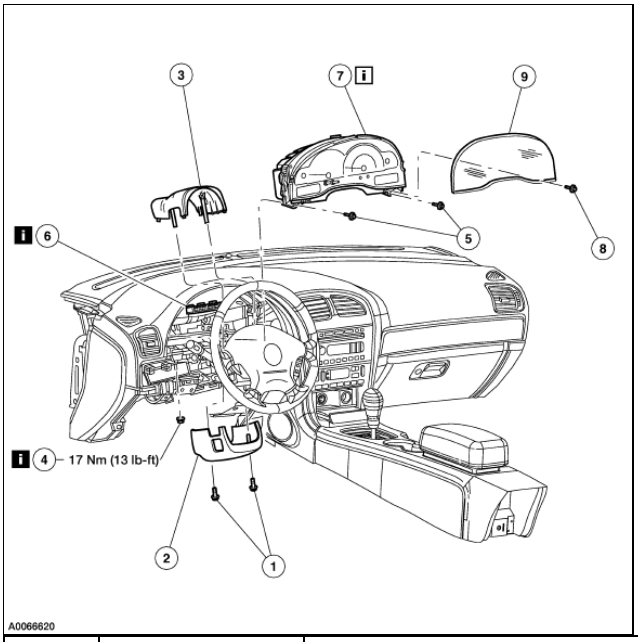
Instrument Cluster Printable View (118 KB)

⚠ CAUTION: Prior to removal of the module, it is necessary to upload module configuration information to the diagnostic tool. This information needs to be downloaded into the new module once installed. For additional information, refer to Section 418-00 .

⚠ CAUTION: Electronic modules are sensitive to electrical charges. If exposed to these charges, damage may result.

NOTE: The instrument cluster is not repairable at the dealership. Do not disassemble the instrument cluster.

1. Tilt the steering column to the lowest position and telescope (extend) the steering column to the farthest position.
2. Disconnect the battery ground cable. For additional information, refer to Section 414-00 .
3. Remove the instrument panel cluster finish panel. For additional information, refer to Section 501-01 .
4. Remove the lower instrument panel steering column reinforcement. For additional information, refer to Section 501-01 .
5. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1	504246	Steering column cover screws (two req'd)
2	3530	Lower steering column cover
3	3533	Upper steering column cover
4	700390	Steering column nuts (four req'd) Removal Note
5	805589	Instrument cluster screws (four req'd)
6	14401	Instrument cluster electrical connectors Removal Note

7	10849	Instrument cluster Installation Note
8		Instrument cluster lens screws (five req'd)
9	10890	Instrument cluster lens

6. To install, reverse the removal procedure.

Item 4: Steering Column Nuts Removal Note

1. Loosen but do not remove the steering column nuts.

Item 6: Instrument Cluster Electrical Connectors Removal Note

1. **⚠ CAUTION: To avoid damage to the instrument cluster lens, place a protective cloth over the upper steering column before removing the instrument cluster.**

   Pull the instrument cluster out from the instrument panel and disconnect the electrical connectors.

Item 7: Instrument Cluster Installation Note

1. **⚠ CAUTION: To avoid damage to the instrument cluster lens, place a protective cloth over the upper steering column before installing the instrument cluster.**

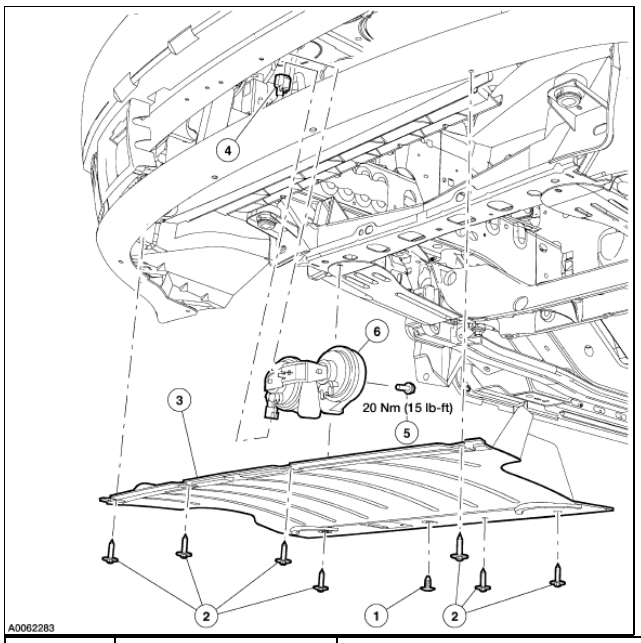
   ⚠ CAUTION: Once the new module is installed, it is necessary to download the module configuration information from the diagnostic tool into the new module. For additional information, refer to Section 418-00 .

   Following installation of the instrument cluster, carry out the Parameter Reset and Key Programming procedure in this section.

Horn

Printable View (165 KB)

1. Raise and support the vehicle. For additional information, refer to Section 100-00 .
2. Remove the components in the order indicated in the following illustration and table.



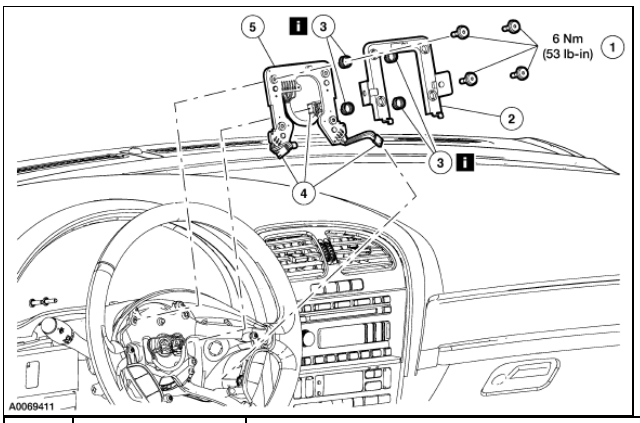
Item	Part Number	Description
1	389358	Front splash shield pin-type retainer
2	801165	Front splash shield bolts (seven req'd)
3	17B635	Front splash shield
4	14290	Horn electrical connectors
5		Horn bolt (part of horn)
6	13A803	Horn

3. To install, reverse the removal procedure.

Horn Switch

Printable View (112 KB)

1. Remove the driver air bag module. For additional information, refer to Section 501-20B .
2. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1		Horn switch pad bolts (part of horn switch) (four req'd)
2		Horn switch pad (part of horn switch)
3		Horn switch springs (part of horn switch) Removal Note
4		Horn switch electrical connectors
5	13A876	Horn switch

3. To install, reverse the removal procedure.

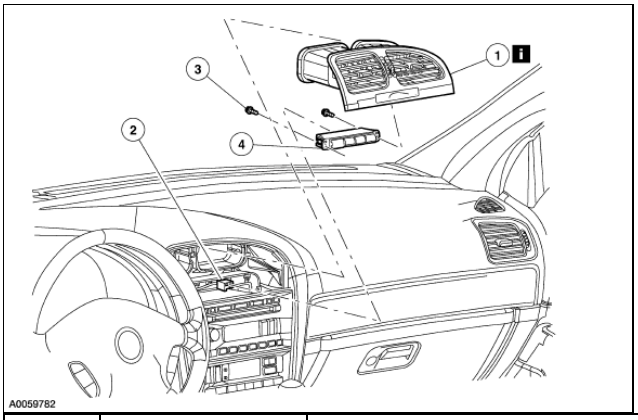
Item 3: Horn Switch Springs Removal Note

1. The four horn switch springs are not attached. To avoid losing the springs use caution when removing the horn switch.

Message Center

Printable View (90 KB)

1. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1	19C894	Instrument panel center finish panel Removal Note
2	14401	Message center electrical connector
3	701678	Message center switch screws (two req'd)
4	10D996	Message center switch

2. To install, reverse the removal procedure.

Item 1: Instrument Panel Center Finish Panel Removal Note

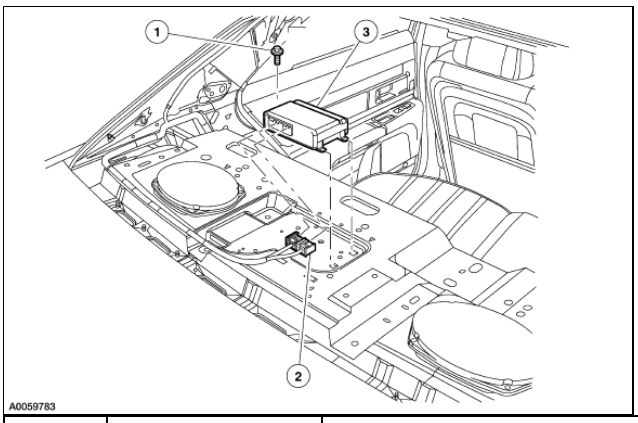
1. The instrument panel center finish panel is held in place by spring clips located on the panel.

Parking Aid Module

Printable View (105 KB)

1. Remove the parcel shelf. For additional information, refer to Section 501-01 .

2. Remove the components in the order indicated in the following illustration and table.



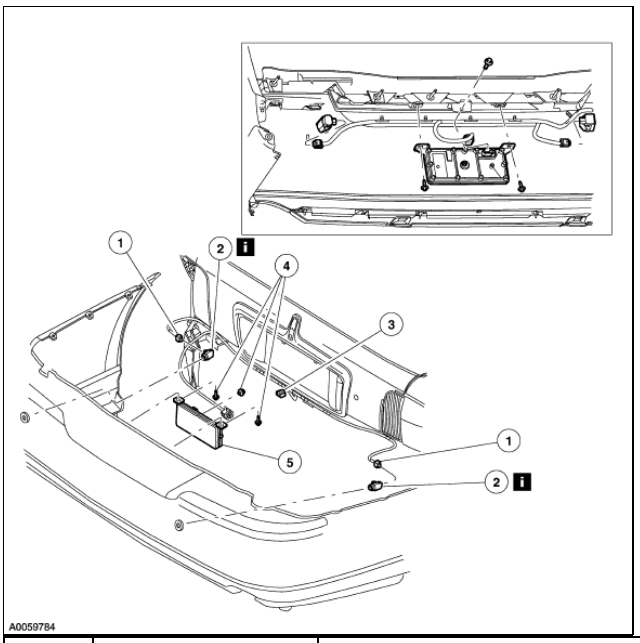
Item	Part Number	Description
1	610936	Parking aid module screw
2	14A005	Parking aid module electrical connector
3	15T850	Parking aid module

3. To install, reverse the removal procedure.

Parking Aid Sensor

Printable View (97 KB)

1. Remove the rear bumper cover. For additional information, refer to Section 501-00 .
2. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1	15K868	Parking aid sensor electrical connector(s)
2	15K859	Parking aid sensor(s) Removal Note
3	15K868	Parking aid electrical connector
4	606673, 606676	Parking aid sensor bolts (three req'd)
5	15K859	Parking aid sensor

3. To install, reverse the removal procedure.

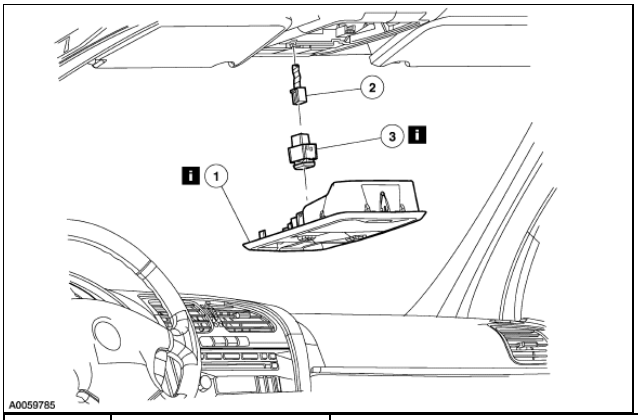
Item 2: Parking Aid Sensor Removal Note

1. Press the retaining tabs to remove the parking aid sensor.

Parking Aid Switch

Printable View (66 KB)

1. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1	519A58	Overhead console Removal Note
2	14334	Parking aid switch electrical connector
3	15A860	Parking aid switch Removal Note

2. To install, reverse the removal procedure.

Item 1: Overhead Console Removal Note

1. The overhead console is held in place by spring clips located on the panel.

Item 3: Parking Aid Switch Removal Note

1. Press the retaining tabs to remove the parking aid switch.

Generator lower nut 3.9L	45	33	
Generator B+ wire nut (3.0L)	7		62

Charging System Printable View (11 KB)

The charging system is a negative ground system controlled by the powertrain control module (PCM).

The generator is belt-driven by the engine accessory drive system. When the engine is started, the generator begins to generate alternating current (AC) which is internally converted to direct current (DC). This current is then supplied to the vehicle's electrical system through the (B+) output circuit of the generator. The generator has an internal voltage regulator that is not replaced separately. A new generator and voltage regulator is installed as an assembly.

Battery

The battery is a 12-volt direct current source connected in a negative ground system. The battery case is sealed and includes one vent hose to release gases to the outside of the vehicle. This vent hose must be attached at all times. New batteries must be of the same vented design. The battery contains a built-in hydrometer with a green dot in the hydrometer eye indicating the battery is OK. A yellow dot, a red dot, or if there is no dot visible, means the battery needs to be charged and tested. The battery has three major functions:

- engine cranking power source
- voltage stabilizer for the electrical system
- temporary power when electrical loads exceed the generator output current

Principles of Operation

The generator on this vehicle has built-in voltage regulator set point. The generator decides optimal charging system voltage based on temperature. The generator has a communication line (GEN MON) to the PCM, which indicates the generator operating duty cycle. This is a pulse width modulated signal. The communication line (GEN MON) is used for fault indiation as well. The generator has an I-terminal used for initally turning on the generator. The generator has a battery sense terminal (A-terminal).

B+ Output Circuit 30-BA6 (RD)

Generator output voltage is supplied through the battery positive (B+) output terminal on the rear of the generator to the battery and the electrical system.

Circuit 30-BA25 (RD)

This is the battery voltage sense or A circuit and is used to sense battery voltage.

Circuit 10-BA25 (GY/RD)

This is the generator I-circuit. This terminal is used to turn the generator on initially. Once the generator is turned on, the generator will only turn off when engine is shut down.

NOTE: If the I circuit 10-BA25 (GY/RD) is open or shorted to ground, the generator will not function. If the engine speed exceeds 3000 rpm, the generator will self-excite, and begin to function normally (the battery light will turn off and the generator will operate normally) until the engine is turned off.

This is a limp-home mode for customer safety.

Circuit 8-BA25 (WH/RD)

The generator monitor (GEN MON) communicates the generator load and error conditions to the PCM. The PCM will send a signal to the instrument cluster using the Standard Corporate Protocol (SCP) bus to turn on the charging system warning indicator if there is an error condition.

Charging System

Inspection & Verification

⚠ WARNING: Batteries contain sulfuric acid. Avoid contact with skin, eyes, or clothing. Also, shield your eyes when working near batteries to protect against possible splashing of the acid solution. In case of acid contact with skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If acid is swallowed, call a physician immediately. Failure to follow these instructions may result in personal injury.

⚠ WARNING: Batteries normally produce explosive gases which can cause personal injury. Therefore, do not allow flames, sparks or lighted substances to come near the battery. When charging or working near a battery, always shield your face and protect your eyes. Always provide ventilation. Failure to follow these instructions may result in personal injury.

⚠ WARNING: When lifting a plastic-cased battery, excessive pressure on the end walls could cause acid to spew through the vent caps resulting in personal injury, damage to the vehicle or to the battery. Lift with a battery carrier or with your hands on opposite corners. Failure to follow these instructions may result in personal injury.

⚠ CAUTION: Do not make jumper connections except as directed. Incorrect connections may damage the voltage regulator test terminals, fuses, or fuse links.

⚠ CAUTION: Do not allow any metal object to come in contact with the generator housing and internal diode cooling fins. A short circuit may result and burn out the diodes.

NOTE: All voltage measurements are referenced to the negative (-) battery post unless otherwise specified.

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Battery case, posts, hold-down clamp, cables and connections • Generator drive (serpentine) belt for condition and to make sure there is correct tension between the belt and the pulley. For additional information, refer to Section 303-01A or Section 303-01B . • Battery charge • Generator pulley • Generator	• Rear battery junction box (BJB) fuse 15 (5A) • Central junction box (CJB) fuse 17 (5A) • Circuitry • Charging system warning indicator • Cables • Powertrain control module (PCM)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. Verify the battery condition. Refer to Battery in this section.

5. If the cause is not visually evident, connect the diagnostic tool to the data link connector and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
    - check that the program card is correctly installed.
    - check the connections to the vehicle.
    - check the ignition switch position.

6. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

7. Carry out the diagnostic tool data link test. If the diagnostic tool reponds with:
    - SCP+, SCP-, ISO circuits fault; all electronic control units no response/not equipped, refer to Section 418-00 .
    - No response/not equipped for powertrain control module (PCM), refer to Section 418-00 .
    - System passed, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out the self-test diagnostics for the PCM.

8. If the DTCs retrieved are related to the concern, go to the PCM Diagnostic Trouble Code (DTC) Index.

9. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Powertrain Control Module Diagnostic Trouble Code (DTC) Index

DTC	Description	Action

P1246	System voltage failure	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

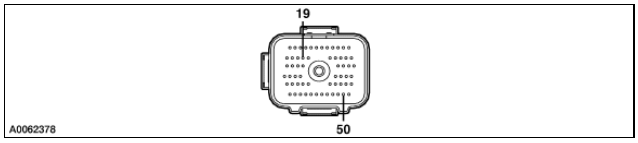
1	30-BA6 (RD)	12 volts with the key on, engine off (KOEO), 10-12 volts during start and 13-15 volts with the key on, engine running (KOER)

Powertrain Control Module C175c



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
19	10-BA25 (GY/RD)	0V with the key off, 0V with the key on, engine off (KOEO), 0.1-4V in start and 1-8V with the key on, engine running (KOER)
50	8-BA25 (WH/RD) (GEN MON)	0V with the key off, 10-14V with the key on, engine off (KOEO), 6-12V key in start and switches between 1-15V with the key on, engine running (KOER)

Pinpoint Test A: The Battery is Discharged or Battery Voltage is Low

Normal Operation

The generator output is supplied through the battery positive output (B+) terminal on the back of the generator to the battery and electrical system. The charging system warning indicator is off with the key ON and the engine running. The charging system warning indicator is on with the key ON and the engine off.

Possible Causes

- battery
- generator
- high key-off current drain(s)

PINPOINT TEST A: THE BATTERY IS DISCHARGED OR BATTERY VOLTAGE IS LOW

Test Step	Result / Action to Take
A1 CHECK THE BATTERY CONDITION	
• Carry out the Battery Condition Test to determine if the battery can hold a charge and is OK for use. Go To Pinpoint Test I . • **Is the battery OK?**	**Yes** GO to A2 . **No** INSTALL a new battery. REFER to Battery in this section. TEST the system for normal operation.
A2 CHECK THE GENERATOR OUTPUT	
• Carry out the Generator On-Vehicle Tests Load Test and No-Load Test. Refer to Component Tests in this section. • **Is the generator OK?**	**Yes** GO to A3 . **No** Go To Pinpoint Test B to continue diagnosis.
A3 CHECK FOR CURRENT DRAINS	
• Carry out the Battery Drain Test. Refer to Component Tests in this section. • **Are there any circuits causing excessive current drains?**	**Yes** REPAIR the faulty circuit as necessary. TEST the system for normal operation. **No** GO to A4 .

A4 CHECK FOR CURRENT DRAINS WHICH SHUT OFF WHEN THE BATTERY IS DISCONNECTED	
• Carry out the Battery Electronic Drains Which Shut Off When the Battery Cable is Disconnected Test. Refer to Component Tests in this section. • **Are there any components causing excessive current drains?**	**Yes** REPAIR the faulty component as necessary. TEST the system for normal operation. **No** Go To Pinpoint Test B to diagnose the charging system not increasing the battery voltage.

Pinpoint Test B: The Charging System Warning Indicator is On With the Engine Running (The Charging System Voltage Does Not Increase)

Normal Operation

With the engine running, the charging system warning indicator is off. The A-circuit 30-BA25 (RD) is 13-15V. The generator regulator compares the A-circuit voltage to an internal set point voltage to determine when to operate. This duty cycle is output to the PCM on the GENMON terminal 8-BA25 (WH/RD). In the case of failure, the GENMON terminal will be 0% (0V), or 100% duty cycle (12-14V). The I-circuit 10-BA25 (GY/RD) is 1-8V with engine running and is only used to turn the generator on initally. The B+ output circuit 30-BA6 (RD) is the generator output supplied to the battery and the electrical system.

Possible Causes

- generator B+ output circuit 30-BA6 (RD) open or high resistance
- I circuit 10-BA25 (GY/RD) open or shorted to ground
- generator
- PCM

PINPOINT TEST B: THE CHARGING SYSTEM WARNING INDICATOR IS ON WITH THE ENGINE RUNNING (THE CHARGING SYSTEM VOLTAGE DOES NOT INCREASE)

Test Step	Result / Action to Take
B1 CHECK GENERATOR B+ OUTPUT CIRCUIT 30-BA6 (RD)	
• Key in OFF position. • Measure the voltage between the generator B+ output terminal, circuit 30-BA6 (RD), component side and ground.  • **Is the voltage within 0.5 volt of battery positive voltage (B+)?**	**Yes** GO to B2 . **No** REPAIR the circuit. TEST the system for normal operation.

B2 CHECK I CIRCUIT 10-BA25 (GY/RD) FOR AN OPEN	
• Connect: Generator C102a. • Key in ON position. • With the engine running, measure the voltage between the generator C102a-2, I circuit 10-BA25 (WH/RD), harness side and ground.  A0062379 • **Is the voltage approximately equal to 1 - 8 volts?**	**Yes** GO to B3 . **No** REPAIR the circuit. TEST the system for normal operation.
B3 CHECK FOR VOLTAGE DROP IN B+ OUTPUT CIRCUIT 30-BA6 (RD)	
• With the engine running, turn on the headlamps and the rear defroster and position the blower motor to the HIGH position. • With the engine at 2,000 rpm, measure the voltage drop between the generator B+ output circuit 30-BA6 (RD), component side and the positive battery terminal.  A0012310 • **Is the voltage drop less than 0.5 volt?**	**Yes** INSTALL a new generator. Refer to Generator 3.0L (4V) , Generator 3.9L in this section. **No** REPAIR the high resistance in the B+ output circuit 30-BA6 (RD). TEST the system for normal operation.

Pinpoint Test C: The Charging System Overcharges (Battery Voltage Is Greater Than 15.5 Volts)

Normal Operation

The generator output is determined by the voltage of the A circuit 30-BA25 (RD). The A circuit voltage is compared to a set voltage internal to the regulator and the regulator controls the generator field current to maintain the correct generator output. The set voltage will vary with temperature and is typically higher in cold temperatures and lower in warm temperatures.

Possible Causes

- A circuit 30-BA25 (RD) high resistance
- battery ground connections
- generator

PINPOINT TEST C: THE CHARGING SYSTEM OVERCHARGES (BATTERY VOLTAGE IS GREATER THAN 15.5 VOLTS)

Test Step	Result / Action to Take
C1 CHECK FOR VOLTAGE DROP IN A CIRCUIT 30-BA25 (RD)	
• Key in OFF position. • Disconnect: Generator C102a. • Measure the voltage drop between the generator C102a-3, A circuit 30-BA25 (RD), harness side and the positive battery terminal.  • **Is the voltage drop less than 0.5 volt?**	**Yes** GO to C2 . **No** REPAIR high resistance in A circuit 30-BA25 (RD). TEST the system for normal operation.
C2 CHECK GENERATOR AND BATTERY GROUND CONNECTIONS	
• Check the ground connections between the generator and the engine, and the battery and the engine. • **Are all ground connections clean and tight?**	**Yes** INSTALL a new generator. REFER to Generator 3.0L (4V) , Generator 3.9L in this section. TEST the system for normal operation. **No** REPAIR ground connections as necessary. TEST the system for normal operation.

Pinpoint Test D: The Charging System Warning Indicator Is ON With The Engine Running And The Battery Increases Voltage

Normal Operation

With the engine running, the charging system warning indicator is off. The A-circuit 30-BA25 (RD) is 13-15V. The generator regulator compares the A-circuit voltage to an internal set point voltage to determine when to operate. This duty cycle is output to the PCM on the GENMON terminal 8-BA25 (WH/RD). In the case of failure, the GENMON terminal will be 0% (0V), or 100% duty cycle (12-14V). The I-circuit 10-BA25 (GY/RD) is 1-8V with engine running and is only used to turn the generator on initially. The B+ output circuit 30-BA6 (RD) is the generator output supplied to the battery and the electrical system.

Possible Causes

- I circuit 10-BA25 (GY/RD) open or shorted to ground
- generator
- GEN MON 8-BA25 (WH/RD) open or shorted to ground
- A circuit 30-BA 25 (RD) open or short to ground

PINPOINT TEST D: THE CHARGING SYSTEM WARNING INDICATOR IS ON WITH THE ENGINE RUNNING AND THE BATTERY INCREASES VOLTAGE

Test Step	Result / Action to Take
D1 CHECK I CIRCUIT 10-BA25 (GY/RD) INTEGRITY	
• Key in OFF position. • Disconnect: Generator C102a. • Disconnect: PCM C175c. • Measure the resistance between the PCM C175c-19 circuit 10-BA25 (BY/RD), harness side and the generator C102a-2, circuit 10-BA25 (GY/RD), harness side; and between the PCM C175c-19 circuit 10-BA25 (GY/RD), harness side and ground.  A0062380 • **Is the resistance less than 5 ohms between the PCM and the generator; and greater than 10,000 ohms between the PCM and ground?**	**Yes** GO to D2 . **No** REPAIR I circuit 10-BA25 (GY/RD). TEST the system for normal operation.
D2 CHECK CIRCUIT 8-BA25 (WH/RD)	
• Measure the resistance between the PCM C175c-50, circuit 8-BA25 (WH/RD), harness side and the generator C102a-1, circuit 8-BA25 (WH/RD), harness side; and between the PCM C175c-50, circuit 8-BA25 (WH/RD), harness side and ground.  A0065969 • **Is the resistance less than 5 ohms between the PCM and the generator and greater than 10,000 ohms between the PCM and ground?**	**Yes** GO to D3 . **No** REPAIR the circuit. TEST the system for normal operation.
D3 CHECK CIRCUIT 30-BA25 (RD)	
• Measure the voltage between the generator C102a-3, circuit 30-BA25 (RD), harness side and ground.  A0041084 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new generator. REFER to Generator - 3.0L (4V) or Generator - 3.9L in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test E: The Charging System Warning Indicator Is Off With The Ignition Switch In The RUN Position And The Engine Off

Normal Operation

The I circuit 8-BA25 (WH/RD) will be 0.1 volts with the key ON (C102a connected) and the engine not running. This will turn the charging system warning indicator on. This circuit is also used to turn the charging system warning indicator on if there is a fault in the charging system.

Possible Causes

- generator
- instrument cluster
- powertrain control module (PCM)

PINPOINT TEST E: THE CHARGING SYSTEM WARNING INDICATOR IS OFF WITH THE IGNITION SWITCH IN THE RUN POSITION AND THE ENGINE OFF

Test Step	Result / Action to Take
E1 CHECK THE CHARGING SYSTEM WARNING INDICATOR	
• Key in OFF position. • Disconnect: Generator C102a. • With the engine off, connect a fused (15A) jumper wire between the generator C102a-1, GEN MON circuit 8-BA25 (WH/RD), harness side and ground.  A0041087 • Key in the ON position. • **Is the charging system warning indicator illuminated?**	**Yes** INSTALL a new generator. REFER to Generator 3.0L (4V) , Generator 3.9L in this section. TEST the system for normal operation. **No** REFER to Section 413-00 for diagnosis and testing of the instrument cluster.

Pinpoint Test F: The Charging System Warning Indicator Flickers or is Intermittent

Normal Operation

With the engine running, the charging system warning indicator should be off. The sense A circuit 30-BA25 (RD) to the generator field coil is 13-15 volts. The I circuit 10-BA25 (GY/RD) is used to turn on the voltage regulator. This circuit is 0.0 volts (C102a connected) with the key ON and the engine not running (1-8V with the engine running). The battery positive output (B+) circuit 30-BA6 (RD) is the generator output supplied to the battery and the electrical system.

NOTE: If the I circuit 10-BA25 (GY/RD) is open or shorted to ground, the generator will not function. If the engine speed exceeds 3000 rpm, the generator will self-excite, and begin to function normally (the battery light will turn off and the generator will operate normally) until the engine is turned off.

This is a limp-home mode for customer safety.

Possible Causes

- rear battery junction box (BJB) fuse 15 (5A) connections
- generator
- generator connections
- instrument cluster

PINPOINT TEST F: THE CHARGING SYSTEM WARNING INDICATOR FLICKERS OR IS INTERMITTENT

Test Step	Result / Action to Take
F1 CHECK FOR LOOSE CONNECTIONS	
• Key in OFF position. • Check all generator, battery, rear battery distribution box connections for looseness, corrosion, loose or bent terminals, or loose eyelets. • **Are all connections clean and tight?**	**Yes** If the warning indicator flickers. INSTALL a new instrument cluster. REFER to Section 413-00 . If the warning indicator is intermittent, GO to F2 . **No** REPAIR as necessary. TEST the system for normal operation.
F2 CHECK FUSE CONNECTIONS	
• Key in START position. • Check the rear BJB fuse 15 (5A) in A circuit 30-BA25 (RD) for looseness by wiggling the fuse and noting the charging system warning indicator operation. • **Does the charging system warning indicator flicker?**	**Yes** REPAIR loose fuse connection(s) as necessary. TEST the system for normal operation. **No** GO to F3 .
F3 CHECK A CIRCUIT 30-BA25 (RD) CONNECTIONS	
• Key in OFF position. • Connect a fused (15A) jumper wire between the generator C102a-3, A circuit 30-BA25 (RD) and the positive battery terminal.  A0060620 • Key in START position. • Note the charging system warning indicator operation. • **Does the charging system warning indicator illuminate?**	**Yes** GO to F4 . **No** REPAIR loose connection(s) in A circuit 30-BA25 (RD). TEST the system for normal operation.
F4 CHECK I CIRCUIT 10-BA25 (GY/RD)	

• Key in OFF position. • Disconnect: PCM C175c. • Disconnect: Generator C102a. • Measure the resistance between the PCM C175c-19, circuit 10-BA25 (GY/RD), harness side and the generator C102a-2, circuit 10-BA25 (GY/RD), harness side; and between the PCM C175c-19, circuit 10-BA25 (GY/RD), harness side and ground.  • **Is the resistance less than 5 ohms between the PCM and the generator and greater than 10,000 ohms between the PCM and ground?**	**Yes** INSTALL a new generator. REFER to Generator 3.0L (4V) or Generator 3.9L in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test G: The Generator is Noisy

Normal Operation

The generator is belt-driven by the engine accessory drive system.

Possible Causes

- accessory drive belt system
- generator mounting
- generator

PINPOINT TEST G: THE GENERATOR IS NOISY

Test Step	Result / Action to Take
G1 CHECK FOR ACCESSORY DRIVE NOISE	
• Key in OFF position. • Check the accessory drive belt for damage and correct installation. Check the accessory mounting brackets and generator pulley for looseness or misalignment. • **Is the accessory drive OK?**	**Yes** GO to G2 . **No** REPAIR as necessary. REFER to Section 303-01A or Section 303-01B for diagnosis and testing of the accessory drive system. TEST the system for normal operation.
G2 CHECK GENERATOR MOUNTING	
• Check the generator mounting for loose bolts or misalignment. • **Is the generator mounted correctly?**	**Yes** GO to G3 . **No** REPAIR as necessary. TEST the system for normal operation.
G3 CHECK GENERATOR FOR ELECTRICAL NOISE	

• Disconnect: Generator C102a. • Key in START position. • Use a stethoscope or equivalent listening device to probe the generator. • **NOTE:** Do not exceed 3,000 rpm or the generator may become electrically functional. • **Is the noise still present?**	**Yes** GO to G4 . **No** INSTALL a new generator. REFER to Generator 3.0L (4V) , Generator 3.9L in this section. TEST the system for normal operation.
G4 CHECK GENERATOR FOR MECHANICAL NOISE	
• Use a stethoscope or equivalent listening device to probe the generator and the accessory drive area for unusual mechanical noise. • **Is the generator the noise source?**	**Yes** INSTALL a new generator. REFER to Generator 3.0L (4V) , Generator 3.9L in this section. TEST the system for normal operation. **No** REFER to Section 303-00 to diagnose the source of the noise.

Pinpoint Test H: Radio Interference

Normal Operation

The generator suppression equipment reduces interference transmitted through the speakers by the vehicle electrical system.

Possible Causes

- generator
- entertainment system

PINPOINT TEST H: RADIO INTERFERENCE

Test Step	Result / Action to Take
H1 VERIFY THE GENERATOR IS THE SOURCE OF THE RADIO INTERFERENCE	
• Key in START position. • Tune the audio unit to a station where the interference is present. • Key in OFF position. • Disconnect: Generator C102a. • Key in START position. • With the engine running, note any audio unit interference. • **NOTE:** Do not exceed 3,000 rpm or the generator may become electrically functional. • **Is the interference present with the generator disconnected?**	**Yes** REFER to Section 415-00 for diagnosis and testing of the entertainment system. **No** INSTALL a new generator. REFER to Generator 3.0L (4V) , Generator 3.9L in this section. TEST the system for normal operation.

Component Tests

Battery Drain Test

NOTE: No production vehicle should have more than a 50 mA (0.050 amp) draw.

Check for current drains on the battery in excess of 50 milliamps (0.050 amp) with all the electrical accessories off and the vehicle at rest. Current drains are tested with the following procedure:

⚠ WARNING: Do not attempt this test on a lead-acid battery that has recently been recharged. Explosive gases may cause personal injury. Failure to follow these instructions may result in personal injury.

⚠ CAUTION: To prevent damage to the meter, do not crank the engine or operate accessories that draw more than 10A.

NOTE: Many modules draw 10 mA (0.010 amp) or more continuously.

NOTE: Use an in-line ammeter between the battery positive or negative post and its respective cable.

NOTE: Typically, a drain of approximately one amp is attributed to an engine compartment lamp, glove compartment lamp, or interior lamp staying on continually. Other component failures or wiring shorts are located by selectively pulling fuses to pinpoint the location of the current drain. When the current drain is found, the meter reading will fall to an acceptable level. If the drain is still not located after checking all the fuses, it is due to the generator.

NOTE: To accurately test the drain on a battery, an in-line digital ammeter must be used. Use of a test lamp or voltmeter is not an accurate method due to the number of electronic modules.

1. Make sure the junction box/fuse panels are accessible without turning on the interior lamps or engine compartment lamp.

2. Drive the vehicle at least five minutes and over 48 km/h (30 mph) to turn on and exercise the vehicle systems.

3. Allow the vehicle to sit with the key off for at least 40 minutes to allow modules to time out/power down.

4. Connect a fused jumper wire between the negative battery cable and the negative battery post to prevent modules from resetting and to catch capacitive drains.

5. Disconnect the negative battery cable from the post without breaking the connection of the jumper wire.

6. **NOTE:** It is very important that continuity is not broken between the battery and the negative battery cable when connecting the meter. If this happens, the entire procedure must be repeated.

   Connect the tester between the negative battery cable and the post. The meter must be capable of reading milliamps and should have a 10 amp capability.

7. **NOTE:** If the meter settings need to be switched or the test leads need to be moved to another jack, the jumper wire must be reinstalled to avoid breaking continuity.

Remove the jumper wire.

NOTE: Amperage draw will vary from vehicle to vehicle depending on the equipment package. Compare to a similar vehicle for reference.

NOTE: No production vehicle should have more than a 50 mA (0.050 amp) draw.

8. If the draw is found to be excessive, pull fuses from the BJB or CJB one at a time and note the current drop. Do not reinstall the fuses until you are finished testing.

9. Check the wiring schematic in the wiring diagram for any circuits that run from the battery without passing through the battery/central junction box. Disconnect these circuits if the draw is still excessive.

Battery Electronic Drains Which Shut Off When the Battery Cable is Disconnected Test

1. Repeat the steps of the battery drain testing.

2. Make sure all the doors are closed and the accessories are off. Without starting the engine, turn the key to ON for a moment, then OFF. Wait a few minutes for the illuminated entry lamps to turn off, if equipped.

3. Connect the ammeter and read the amperage draw.

The current reading (current drain) should be less than 50 mA (0.05 amp). If the current drain exceeds 50 mA (0.050 amp) after a few minutes, and if this drain did not show in previous tests, the drain is most likely caused by an inoperative electronic component. As in previous tests, remove the fuses from the battery/central junction box one at a time to locate the problem circuit.

Generator On-Vehicle Tests

⚠ CAUTION: To prevent damage to the generator, do not make the jumper wire connections except as directed.

⚠ CAUTION: Do not allow any metal object to come in contact with the housing and the internal diode cooling fins with the ignition switch in ON or OFF position. A short circuit may result and burn out the diodes.

NOTE: Battery posts and cable clamps must be clean and tight for accurate meter indications.

NOTE: Refer to the battery tester manual for complete directions for testing the charging system.

1. Turn off all the lamps and electrical components.

2. Place the transmission in NEUTRAL and apply the parking brake.

3. Carry out the Load Test and No-Load Test according to the following component tests:

Generator On-Vehicle Tests Load Test

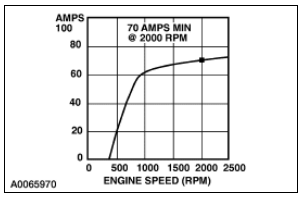
1. Switch the tester to the ammeter function.

2. Connect the positive and negative leads of the tester to the corresponding battery terminals.

3. Connect the current probe to the generator B+ output terminal, circuit 30-BA6 (RD).

4. With the engine running at approximately 2,000 rpm, adjust the tester load bank to determine the output of the generator. Generator output should be at least 70 amps.

125 Amp Generator



5. With the engine running, turn the A/C on, the blower motor on high speed and the headlamps on high beam.

6. Increase the engine speed to approximately 2,000 rpm. The voltage should increase a minimum of 0.5 volt above the base voltage.
   - If the voltage does not increase as specified, carry out the Generator On-Vehicle Tests No-Load Test in this section.
   - If the voltage increases as specified, the charging system is operating normally.

Generator On-Vehicle Tests No-Load Test

1. Switch the tester to the voltmeter function.

2. Connect the voltmeter positive lead to the generator B+ terminal and the negative lead to ground.

3. Turn all electrical accessories off.

4. With the engine running at approximately 2,000 rpm, check the generator output voltage. The voltage should be between 13 and 15 volts. If not, GO to Symptom Chart or back to the pinpoint test.

Battery Printable View (14 KB)

Special Tool(s)

ST2442-A	Micro 490 Digital Battery Analyzer 162-00004 or equivalent

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Battery • Battery mounting	• Battery cables • Battery terminals

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, proceed to the pinpoint test.

Pinpoint Test I: Battery Condition Test

Normal Operation

Battery condition is determined by measuring battery terminal voltage after a specific discharge current is applied for a specified time period.

Possible Causes

- battery charge
- battery

PINPOINT TEST I: BATTERY CONDITION TEST

Test Step	Result / Action to Take
I1 TEST BATTERY CONDITION	
NOTE: No battery with a red test eye should be replaced. The red test eye means the battery is discharged, not necessarily defective. **NOTE:** Failure to fully charge the battery before retesting may cause false readings. • Verify the battery condition using the Battery Analyzer. • **Is the battery OK?**	**Yes** Does the meter read GOOD BATTERY? RETURN the battery to service. Does the meter read GOOD-RECHARGE? CHARGE the battery and RETURN to service. Does the meter read CHARGE & RETEST? Fully CHARGE the battery and RETEST. **No** Does the meter read REPLACE BATTERY? INSTALL a new battery. Does the meter read BAD CELL-REPLACE? INSTALL a new battery.

Battery Disconnect

Printable View (109 KB)

⚠ WARNING: Batteries normally produce explosive gases which can cause personal injury. Therefore, do not allow flames, sparks or lighted substances to come near the battery, always shield your face and protect your eyes. Always provide ventilation. Failure to follow these instructions may result in personal injury.

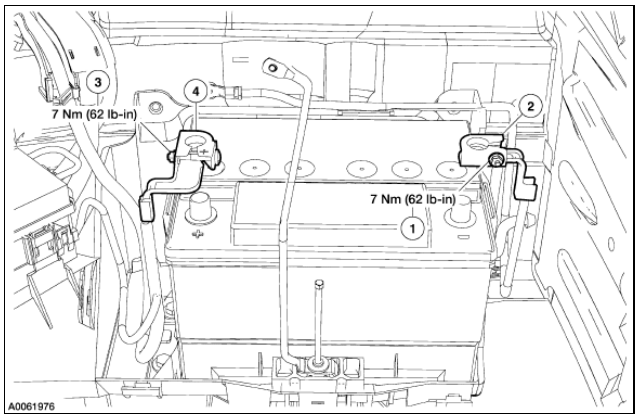
⚠ WARNING: To avoid accidental deployment and possible injury, the backup power supply must be depleted before repairing or installing any front or side air bag supplemental restraint system (SRS) components and before repairing, installing, adjusting or striking components near the front or side air bag sensors, such as doors, instrument panel, console, door latches, strikers, seats and hood latches. To deplete the backup power supply energy, disconnect the battery ground cable and wait at least one minute. Be sure to disconnect any auxiliary batteries and power supplies (if equipped). Failure to follow these instructions may result in personal injury.

⚠ WARNING: When lifting a battery, excessive pressure on the end walls could cause acid to spew through the vent caps, resulting in personal injury. Lift with a battery carrier or with your hands on opposite corners. Failure to follow these instructions may result in personal injury.

⚠ WARNING: Keep out of the reach of children. Batteries contain sulfuric acid. Avoid contact with skin, eyes or clothing. Also, shield your eyes when working near the battery to protect against possible splashing of the acid solution. In case of acid contact with the skin or eyes, flush immediately with water for a minimum of 15 minutes and get prompt medical attention. If acid is swallowed, call a physician immediately. Failure to follow these instructions may result in personal injury.

NOTE: Because the engine is electronically controlled by the powertrain control module (PCM), some control conditions are maintained by power from the battery. When the battery is disconnected or a new battery is installed, the engine must relearn its idle and fuel trim strategy for optimum driveability and performance. Allow the engine to idle for one minute. The relearning process will automatically complete itself as the vehicle is driven. The vehicle may need to be driven. If the engine is not allowed to relearn its idle trim, the idle quality may be adversely affected until the idle trim is eventually relearned. Additionally, to account for customer driving habits and conditions, the automatic transmission must relearn its adaptive strategy. Optimal shifting will resume within a few hundred kilometers (miles) of operation. The clock and radio presets must be reset once the battery is reconnected. Check the front windows for one-touch up operation and the moonroof (if equipped) for one-touch close operation. If any have lost this functionality, they must be re-initialized. For window motor initialization, refer to Section 501-00 . For roof opening panel motor initialization, refer to Section 501-01 .

1. Disconnect the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1	W520201-S427	Negative terminal nut
2	14301	Battery negative terminal
3	W520201-S427	Positive terminal nut
4	14300	Battery positive terminal

2. To reconnect, reverse the disconnect procedure.

Item 11: Rear Battery Junction Box (BJB) Removal Note

1. Position the cover to the full open position.

Item 14: Positive Battery Cable Locator Removal Note

1. Release the positive battery cable from the cable locator.

Item 15: Positive Battery Cable Locator Removal Note

1. Release the positive battery cable from the cable locator.

Item 17: Positive Battery Cable Locator Removal Note

1. Release the positive battery cable from the cable locator.

Item 19: Positive Battery Cable Shield Screws Removal Note

1. Remove the screws and open the top of the shield to access the positive battery cable.

Item 37: Nut Removal Note

1. On 3.9L engines remove the generator. For additional information, refer to Generator - 3.9L in this section.

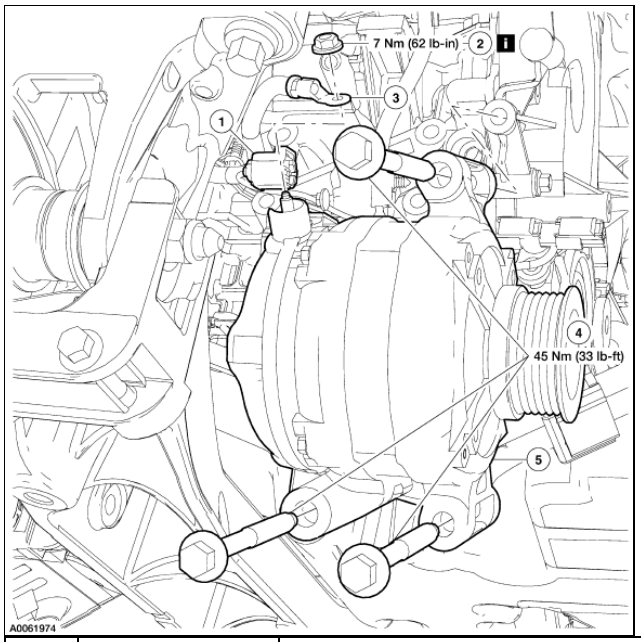
Generator 3.0L (4V) Printable View (205 KB)

⚠ CAUTION: The generator must be supported by hand after removing the bolts prior to disconnecting the electrical connector or damage to the harness may result.

⚠ CAUTION: Care must be taken when removing the generator to prevent damage to the air conditioning and cooling lines.

NOTE: The A/C suction line may need to be positioned rearward to ease removal of the generator.

1. Disconnect the battery. For additional information, refer to Battery Disconnect in this section.
2. Position the front end accessory drive belt aside.
3. Remove the front valance panel and air deflector.
4. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1		Generator electrical connector (part of 14305)
2	W705790-S301	Generator B+ wire nut Removal Note
3		Generator B+ wire (part of 14305)
4	W704747-S301	Generator mounting bolts
5	10300	Generator

5. To install, reverse the removal procedure.

Item 2: Generator B+ Wire Nut Removal Note

1. Position the connector boot aside to access the nut.

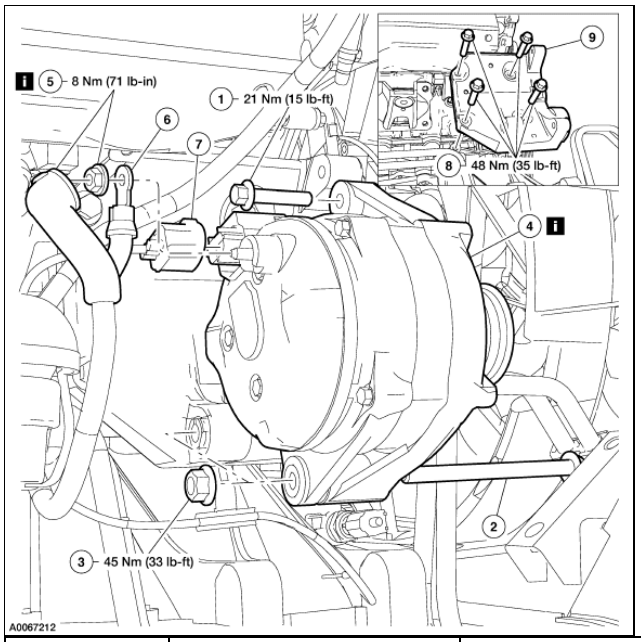
Generator 3.9L Printable View (204 KB)

⚠ CAUTION: The generator must be supported by hand after removing the bolts prior to disconnecting the electrical connector or damage to the harness may result.

⚠ CAUTION: Care must be taken when removing the generator to prevent damage to the air conditioning and cooling lines.

NOTE: The A/C suction line may need to be positioned rearward to ease removal of the generator.

1. Disconnect the battery. For additional information, refer to Battery Disconnect in this section.
2. Position the front end accessory drive belt aside.
3. Remove the front valance panel and air deflector.
4. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1	W704756-S309	Upper generator bolt
2	10A396	Lower generator bolt

Audio unit amplifier screws	5		44

Entertainment System Printable View (10 KB)

NOTE: The antenna cable is integral to the wiring harness and the center imaging amplifier is located under the instrument panel to the left of the steering column.

Normal Operation

The audio system is enabled when the key is in the RUN or ACC position. The CDX6 audio unit uses a center imaging amplifier and a subwoofer amplifier to power the center imaging and subwoofer speakers, respectively. The door speakers are powered directly by the audio unit. The vehicle navigation radio (VNR) unit uses an audio unit amplifier and a subwoofer amplifier to power the door speakers and the subwoofer speakers, respectively. The DM100i unit directly powers the four door speakers. It is not equipped with a subwoofer or center imaging speakers. All audio units have steering wheel controls. The antenna system contains an antenna module that helps reduce interference when using the AM/FM bands.

Principles of Operation CDX6 and DM100i

When the audio unit is powered up, a wake-up signal is sent to the subwoofer, amplifier, and audio unit amplifiers. Audio output signals are then sent continuously to the subwoofer amplifier and audio unit amplifier. These signals are then amplified and sent to the speakers as a fluctuating AC voltage, thus producing sound from the speakers. The steering wheel controls are a multiplexed system that use different resistor values to produce different voltage levels on a single circuit. Each button that is pressed results in a unique voltage signal at the audio unit. This voltage signal is then interpreted by the audio unit as a distinct command. The audio unit is linked to the SCP network and therefore, trouble codes can be obtained with a diagnostic tool. The audio unit also has a self-diagnostic mode that can be entered by pressing preset buttons 3 and 6 simultaneously.

Principles of Operation VNR

When the audio unit is powered up, a wake-up signal is sent to the subwoofer, amplifier, and audio unit amplifiers. Audio output signals are then sent continuously to the subwoofer amplifier and audio unit amplifier. These signals are then amplified and sent to the speakers as a fluctuating AC voltage, thus producing sound from the speakers. The steering wheel controls are a multiplexed system that use different resistor values to produce different voltage levels on a single circuit. Each button that is pressed results in a unique voltage signal at the audio unit. This voltage signal is then interpreted by the audio unit as a distinct command.

The navigation unit is responsible for generating the displays shown on the VNR screen by using video circuits (color generation and display synchronization), between the navigation unit and VNR. When an on-screen menu key is pressed on the VNR screen a signal is sent to the navigation unit through the controller area network (CAN) circuits. Refreshed data is then sent through the video circuits, and a new screen is displayed corresponding to which key was pressed. Diagnostic communication between the navigation unit and the VNR takes place over the CAN circuits. REFER to Section 419-02 for further information about the navigation system.

Entertainment System Printable View (436 KB)

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052, or equivalent diagnostic tool with appropriate adapter cable

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Audio unit • Navigation system module • Antenna or antenna cable(s) • Antenna module • Speakers, mounting/speaker cones • Subwoofer amplifier • Center imaging amplifier • High powered amplifier • Radio ignition interference capacitors, radio frequency interference suppression bond, and radio receiver hood bonding strap	• Central junction box (CJB) fuses: ♦ 2 (5A) ♦ 18 (20A) ♦ 27 (10A) • Battery junction box (BJB) fuses: ♦ 14 (10A) ♦ 18 (20A) ♦ 22 (20A) ♦ 25 (40A) • Ignition switch

	• Circuitry

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, connect the diagnostic tool to the data link connector (DLC) located beneath the instrument panel and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:

- check that the program card is correctly installed.
- check the connections to the vehicle.
- check the key position.

5. **NOTE:** The audio unit must be in AM, FM1 or FM2 mode to enter diagnostic tool tester diagnostics.

   If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

6. Carry out the diagnostic tool data link test. If the diagnostic tool responds with:

- SCP+ or SCP- circuit fault; all electronic control units no response/not equipped, refer to section 418-00.
- System passed, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out self-test diagnostics for the audio unit.

7. If the DTCs retrieved are related to the concern, go to the Audio Unit Diagnostic Trouble Code (DTC) Index or the Navigation System Module Diagnostic Trouble Code (DTC) Index.

8. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

9. If the fault is visually evident, GO to Symptom Chart .

10. If the fault is not visually evident, proceed to speaker walk-around test (CDX6 and DM100i), audio unit self-diagnostic mode or the diagnostic tool (VNR).

Audio Unit Self-Diagnostic Mode CDX6 and DM100i

NOTE: To enter the speaker walk-around test or the audio unit self-diagnostic mode, the audio unit must be on and in radio tuner mode (AM/FM). The audio unit self-diagnostic mode can only be entered while in the speaker walk-around test.

11. To enter the following audio unit self-diagnostic modes, press the preset button desired while in the speaker walk-around test. This will abort the speaker walk-around test and start the selected test.

12. The audio unit self-diagnostic mode has five tests available:
    - Preset button 1 = Audio internal/external SELF TEST. If SELF FAIL is displayed, press TUNE > to scroll view the stored DTCs . Refer to the Audio Unit Diagnostic Trouble Code (DTC) Index. If the system is OK, SELF PASS is displayed.
    - Preset button 2 = View/clear continuous diagnostic trouble codes (DTCs). NO DTCs is displayed if no DTCs are retrieved. If DTCs FOUND is displayed, press TUNE > button to view the DTCs retrieved. Refer to the Audio Unit Diagnostic Trouble Code (DTC) Index. To clear all DTCs press the EJECT button. DTCs CLEAR will be displayed.

- **NOTE:** Always document, clear and carry out the audio unit on-demand self-test again.

  Preset button 3 = SIGNAL TEST. This test measures the average strength at the current tuner setting.
- Preset button 4 = Software configuration level. This test queries each audio system controller for its software configuration level. SOFT LEVELS will be displayed upon completion of the query. Press TUNE > to scroll view the software configuration version level.
- Preset button 5 = DISPLAY TEST. This test will light all the audio unit display segments for five seconds and then turn all segments off. When the test is complete, DISPLAY TEST is displayed on the bezel.
- Preset button 6 = CONFIG LEVELS. This will show the software configuration for the audio unit. Press TUNE > to scroll view the audio unit software configuration.

13. To exit the audio unit self-diagnostic mode, turn the ignition switch or the audio unit OFF.

14. If the concern remains and the fault is not detected, proceed to Diagnostic Tool.

Speaker Walk-Around Test All Audio Units Except VNR

NOTE: To enter the speaker walk-around test or the audio unit self-diagnostic mode, the audio unit must be ON and in radio tuner mode (AM/FM).

1. To enter the speaker walk-around test, simultaneously press the audio unit preset buttons 3 and 6.

2. The speaker walk-around test stops at each speaker and applies a different tone to each speaker for about 1-2 seconds. Each speaker is tested and displayed on the audio unit in the following sequence: RF, LF, LR, RR, Subwoofer I, Subwoofer II.

3. The speaker walk-around test automatically continues and tests for a speaker short. If a speaker short exists, SPKR SHORT will be displayed.

Audio Unit Self-Diagnostic Mode Software Configuration Display

Controller	Description	Audio Unit Display Example
Main	Main Micro Software Version	MAIN ##.##.##
ADSP	ADSP Micro Software Version	ADSP ##.##.##
CDSP	CDSP Micro Software Version	CDSP ##.##.##
CDDJ	CDDJ Software Version	CDDJ ##.##.##

RICP	RICP Software Version	RICP ##.##.##

Audio Unit Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1342	ECU is Defective	Audio Unit	DOCUMENT and CLEAR the DTCs. CARRY OUT the Audio Unit On-Demand Self-Test. REMOVE the audio unit and SEND it

			to an authorized audio system repair facility if DTC B1342 is retrieved again. REFER to Audio Unit in this section. TEST the system for normal operation.
B2103	Antenna Not Connected	Audio Unit	Go To Pinpoint Test C .
B2401	Audio Tape Deck Mechanism Fault	Audio Unit	Not applicable for CDX6.
B2404	Audio Steering Wheel Switch Circuit Fault	Audio Unit	Go To Pinpoint Test H .
B2405	Audio Single-Disc CD Player Thermal Shutdown Fault	Audio Unit	Not applicable for CDX6.
B2406	Audio Single-Disc CD Player Internal Fault	Audio Unit	Not applicable for CDX6.
B2477	Module Configuration Fault	Audio Unit	REFER to Section 418-00 .
B2913	Subwoofer Not Connected	Audio Unit	Go To Pinpoint Test G .
U2003	Audio CD/DJ is Not Responding	Audio Unit	**NOTE:** U2003 is retrieved if CD/DJ is not present, disconnected, or inoperative. Not applicable for CDX6.
U2005	Audio Rear Integrated Control Panel Unit is Not Responding	Audio Unit	**NOTE:** U2005 is retrieved if RICP is not present, disconnected, or inoperative. Not applicable for CDX6.
U2008	Audio Phone is Not Responding	Audio Unit	Not applicable.
U2014	Audio Subwoofer Unit is Not Responding	Audio Unit	Not applicable for CDX6.
U2020	Center Image Amplifier is Not Responding	Audio Unit	Not applicable for CDX6.

Navigation System Module Diagnostic Trouble Code (DTC) Index

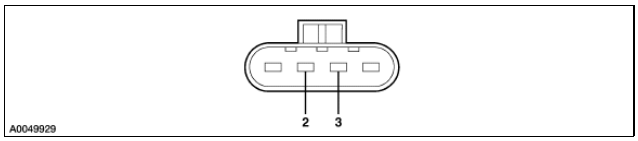
DTC	Description	Source	Action
B2103	Antenna Not Connected	Navigation System Module	Go To Pinpoint Test C .
B2208	Navigation System Module to Audio Unit Communication Error	Navigation System Module	REFER to Section 419-02 .
B2403	Audio CDDJ Internal Fault	Navigation System Module	REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Audio Unit in this section. TEST the system for normal operation.
B2404	Audio Steering Wheel Switch Circuit Fault	Navigation System Module	Go To Pinpoint Test H .

B2858	Audio Unit Is Defective	Navigation System Module	REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Audio Unit in this section. TEST the system for normal operation.
B2913	Subwoofer Not Connected	Navigation System Module	Go To Pinpoint Test G .
C1192	Vehicle Speed Circuit Failure.	Navigation System Module	If the map icon functions correctly, REMOVE the audio unit and send it to an authorized audio system repair facility. REFER to Audio Unit in this section. TEST the system for normal operation. If the map icon does not function correctly, REFER to Section 419-02 for further information.
U1016	Vehicle Speed Signal Failure.	Navigation System Module	If the map icon functions correctly, INSTALL a new audio unit. REFER to Audio Unit in this section. TEST the system for normal operation. If the map icon does not function correctly, REFER to Section 419-02 for further information.

Symptom Chart

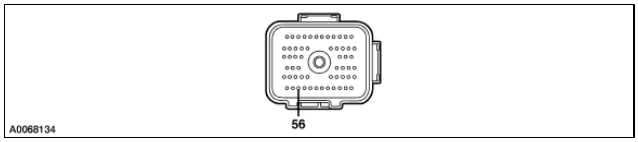
Symptom Chart
Connector Circuit Reference

Steering Wheel Audio Control Switch Connector



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
2	Circuit 8-MD26 (WH/BK) voltage reference from the audio/navigation control unit.	Less than 5 ohms between the steering wheel control switches and the clockspring. Greater than 10,000 ohms between the steering wheel control switch and ground.
3	Circuit 31S-PG24 (BK/OG) auxiliary audio controls, steering wheel ground, through the PCM.	Less than 5 ohms between the steering wheel control switch and the clockspring.

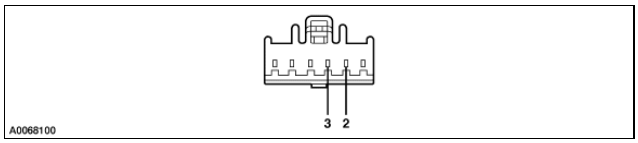
Powertrain Control Module (PCM) C175a



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement

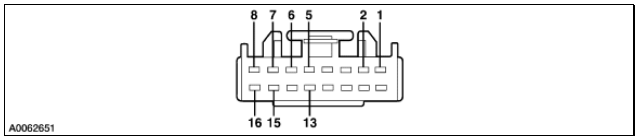
56	Circuit 31S-PG24 (BK/OG) steering wheel audio controls ground.	Less than 5 ohms between the steering wheel audio control switch and ground.

Clockspring C218b



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
2	Circuit 8-MD26 (WH/BK) auxiliary audio controls, steering wheel, reference voltage.	Greater than 10 volts between audio unit and ground.
3	Circuit 31S-PG24 (BK/OG) steering wheel assembly, switch, common.	Less than 5 ohms between steering wheel switch and ground.

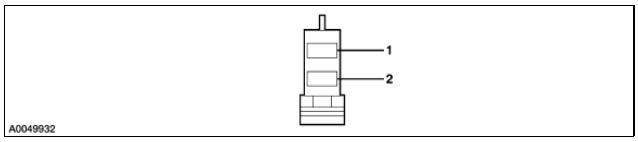
Center Imaging Amplifier C225



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	Circuit 1-MD12 (WH) center imaging audio signal	Less than 5 ohms between the audio unit and the center imaging amplifier. Greater that 10,000 ohms between the audio unit and ground.
2	Circuit 2-MD12 (GY) center imaging audio return	Less than 5 ohms between the audio unit and the center imaging amplifier. Greater that 10,000 ohms between the audio unit and ground.
5	Circuit 8-MD31 (WH/GN) right center imaging speaker signal	Less than 5 ohms between the speaker and the center imaging amplifier. Greater than 10,000 ohms between the center imaging amplifier and ground.
6	Circuit 10-MD31 (GY/OG) right center imaging speaker return	Less than 5 ohms between the speaker and the center imaging amplifier. Greater than 10,000 ohms between the center imaging amplifier and ground.
7	Circuit 8-MD30 (WH/BU) left center imaging speaker return	Less than 5 ohms between the speaker and the center imaging amplifier. Greater than 10,000 ohms between the center imaging amplifier and ground.
8	Circuit 10-MD30 (GY/VT) left center imaging speaker signal	Less than 5 ohms between the speaker and the center imaging amplifier. Greater than 10,000 ohms between the center imaging amplifier and ground.
13	Circuit 7-MD12 (YE) center imaging amplifier enable	Less than 5 ohms between the audio unit and the center imaging amplifier. Greater than 10,000 ohms between the center imaging amplifier and ground.

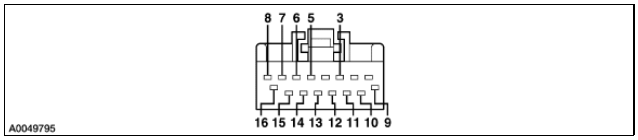
15	Circuit 31-MD12 (BK/YE) ground circuit	Less than 5 ohms between the center imaging amplifier and ground.
16	Circuit 29-MD12 (OG/YE) B+ battery feed	Greater than 10 volts between the center imaging amplifier and ground.

Center Imaging Speaker LH C230, RH C231



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1 (C230)	Circuit 8-MD30 (WH/BU) center imaging amplifier output	Less than 5 ohms between the speaker and the center imaging amplifier. Greater than 10,000 ohms between the center imaging amplifier and ground.
2 (C230)	Circuit 10-MD30 (GY/VT) center imaging amplifier return	Less than 5 ohms between the speaker and the center imaging amplifier. Greater than 10,000 ohms between the center imaging amplifier and ground.
1 (C231)	Circuit 8-MD31 (WH/GN) center imaging amplifier output	Less than 5 ohms between the speaker and the center imaging amplifier. Greater than 10,000 ohms between the center imaging amplifier and ground.
2 (C231)	Circuit 10-MD31 (GY/OG) center imaging amplifier return	Less than 5 ohms between the speaker and the center imaging amplifier. Greater than 10,000 ohms between the center imaging amplifier and ground.

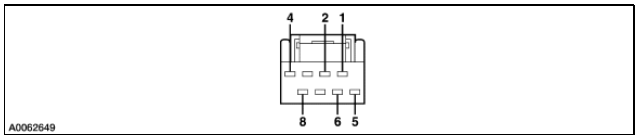
CDX6 Audio Unit C240a



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
3	Circuit 50-MD15 (GY/OG) B+ power feed START position only	Greater than 10 volts with key in START position.
5	Circuit 8-MD18 (WH) RR speaker output	Less than 5 ohms between the audio unit and the speaker and greater than 10,000 ohms between the audio unit and ground.
6	Circuit 10-MD18 (GY) RR speaker return	Less than 5 ohms between the audio unit and the speaker and greater than 10,000 ohms between the audio unit and ground.
7	Circuit 8-MD17 (WH/RD) RF speaker output	Less than 5 ohms between the audio unit and the speaker and greater than 10,000 ohms between the audio unit and ground.
8		

	Circuit 10-MD17 (GY/RD) RF speaker return	Less than 5 ohms between the audio unit and the speaker and greater than 10,000 ohms between the audio unit and ground.
9	Circuit 29-MD15 (OG/BK) B+ battery feed, audio unit memory	Greater than 10 volts between the audio unit and ground.
10	Circuit 75-MD15 (YE/GN) B+ battery feed with the key in the ON and ACCESSORY positions	Greater than 10 volts between the audio unit and ground with the key in the ON or ACCESSORY positions.
11	Circuit 31-MD15B (BK/GN) audio unit ground	Less than 5 ohms between the audio unit and ground.
12	Circuit 8-MD11 (WH/VT) LR speaker output	Less than 5 ohms between the audio unit and the speaker and greater than 10,000 ohms between the audio unit and ground.
13	Circuit 10-MD11 (GY/WH) LR speaker return	Less than 5 ohms between the audio unit and the speaker and greater than 10,000 ohms between the audio unit and ground.
14	Circuit 8-MD10 (WH/BK) LF speaker output	Less than 5 ohms between the audio unit and the speaker and greater than 10,000 ohms between the audio unit and ground.
15	Circuit 10-MD10 (GY/BK) LF speaker return	Less than 5 ohms between the audio unit and the speaker and greater than 10,000 ohms between the audio unit and ground.
16	Circuit 31-MD15A (BK/GN) audio unit ground	Less than 5 ohms between the audio unit and ground.

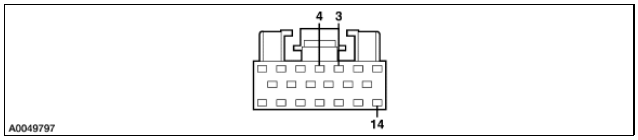
CDX6 Audio Unit C240b



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	Circuit 2-MD19 (GY/RD) subwoofer audio return	Less than 5 ohms between the audio unit and the subwoofer amplifier. Greater than 10,000 ohms between the audio unit and ground.
2	Circuit 1-MD19 (WH/RD) subwoofer audio output	Less than 5 ohms between the audio unit and the subwoofer amplifier. Greater than 10,000 ohms between the audio unit and ground.
4	Circuit 7-MD19 (YE/RD) subwoofer enable/clip detection	Less than 5 ohms between the audio unit and the subwoofer amplifier. Greater than 10,000 ohms between the audio unit and ground.
5	Circuit 2-MD12 (GY) center imaging amplifier return	Less than 5 ohms between the audio unit and the center imaging amplifier. Greater than 10,000 ohms between the audio unit and ground.
6	Circuit 1-MD12 (WH) center imaging amplifier output	Less than 5 ohms between the audio unit and the center imaging amplifier. Greater than 10,000 ohms between the audio unit and ground.

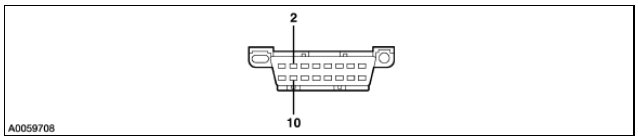
8	Circuit 7-MD12 (YE) center imaging amplifier enable	Less than 5 ohms between the audio unit and the center imaging amplifier. Greater than 10,000 ohms between the audio unit and ground.

CDX6 Audio Unit C240c



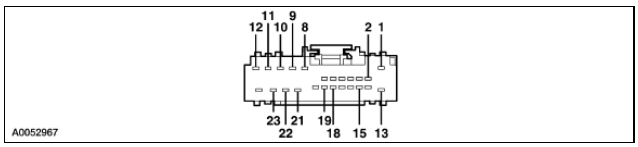
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
3	Circuit 4-EG10 (GY/BK) standard corporate protocol (SCP)	Less than 5 ohms between the audio unit and data link connector. Greater than 10,000 ohms between the audio unit and ground.
4	Circuit 5-EG10 (BU/YE) standard corporate protocol (SCP)	Less than 5 ohms between the audio unit and data link connector. Greater than 10,000 ohms between the audio unit and ground.
14	Circuit 8-MD26 (WH/BK) steering wheel audio controls reference signal	Less than 5 ohms between the audio unit and the steering wheel control switch. Greater than 10,000 ohms between the audio unit and ground.

Data Link Connector (DLC) C251



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
2	Circuit 4-EG7 (GY/RD) Standard Corporate Protocol (SCP) J1850 Communication Network	Less than 5 ohms between the audio unit and DLC and greater than 10,000 ohms between the audio unit and ground.
10	Circuit 5-EG7 (BU/RD) Standard Corporate Protocol (SCP) J1850 Communication Network	Less than 5 ohms between the audio unit and DLC and greater than 10,000 ohms between the audio unit and ground.

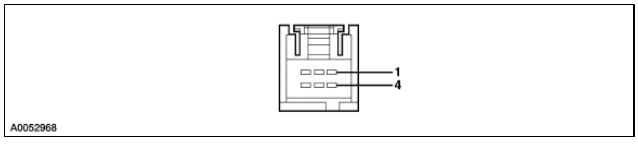
DM100i Audio Unit C290b



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement

1	Circuit 29-MD15 (OG/YE) B+ battery feed, audio unit memory	Greater than 10 volts between the audio unit and ground.
2	Circuit 75-MD15 (YE/GN) B+ battery feed with the key in the ON and ACCESSORY positions	Greater than 10 volts between the audio unit and ground with the key in the ON or ACCESSORY positions.
8	Circuit 8-MD10 (WH/BK) LF speaker output	Less than 5 ohms between the audio unit and the speaker and greater than 10,000 ohms between the audio unit and ground.
9	Circuit 8-MD11 (WH/VT) LR speaker output	Less than 5 ohms between the audio unit and the speaker and greater than 10,000 ohms between the audio unit and ground.
10	Circuit 8-MD18 (WH) RR speaker output	Less than 5 ohms between the audio unit and the speaker and greater than 10,000 ohms between the audio unit and ground.
11	Circuit 8-MD17 (WH/RD) RF speaker output	Less than 5 ohms between the audio unit and the speaker and greater than 10,000 ohms between the audio unit and ground.
12	Circuit 10-MD17 (GY/RD) RF speaker return	Less than 5 ohms between the audio unit and the speaker and greater than 10,000 ohms between the audio unit and ground.
13	Circuit 31-MD15B (BK/GN) audio unit ground	Less than 5 ohms between the audio unit and ground.
15	Circuit 50-MD15 (GY/OG) B+ power feed START position only	Greater than 10 volts with key in START position.
18	Circuit 8-MD26 (WH/BK) steering wheel audio controls reference signal	Less than 5 ohms between the audio unit and the steering wheel control switch. Greater than 10,000 ohms between the audio unit and ground.
19	Circuit 31S-MD26 (BK/RD) steering wheel audio controls reference signal	Less than 5 ohms between the audio unit and the steering wheel control switch. Greater than 10,000 ohms between the audio unit and ground.
21	Circuit 10-MD10 (GY/BK) LF speaker return	Less than 5 ohms between the audio unit and the speaker and greater than 10,000 ohms between the audio unit and ground.
22	Circuit 10-MD11 (GY/WH) LR speaker return	Less than 5 ohms between the audio unit and the speaker and greater than 10,000 ohms between the audio unit and ground.
23	Circuit 10-MD18 (GY) RR speaker return	Less than 5 ohms between the audio unit and the speaker and greater than 10,000 ohms between the audio unit and ground.

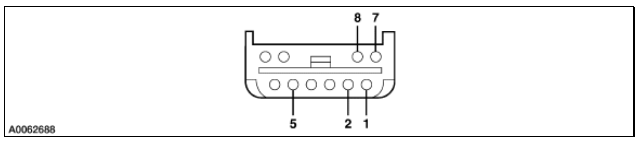
DM100i Audio Unit C290c



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement

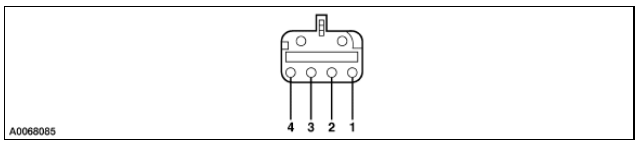
1	Circuit 4-EG10 (GY/BK) standard corporate protocol (SCP)	Less than 5 ohms between the audio unit and data link connector. Greater than 10,000 ohms between the audio unit and ground.
4	Circuit 5-EG10 (BU/YE) standard corporate protocol (SCP)	Less than 5 ohms between the audio unit and data link connector. Greater than 10,000 ohms between the audio unit and ground.

Subwoofer Amplifier C466a



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	Circuit 7-MD19 (YE/RD) subwoofer enable/clip detection	5 volts with audio unit ON. Less than 5 ohms between the audio unit and the subwoofer amplifier. Greater than 10,000 ohms between the audio unit and ground.
2	Circuit 31-MD19 (BK/BU) subwoofer amplifier ground	Less than 5 ohms between the subwoofer amplifier and ground.
5	Circuit 30-MD19A (RD/BU) B+ constant battery feed	Greater than 10 volts between the subwoofer amplifier and ground. Less than 5 ohms between the subwoofer amplifier and the CJB.
7	Circuit 1-MD19 (WH/RD) subwoofer audio output	Less than 5 ohms between the subwoofer amplifier and the audio unit. Greater than 10,000 ohms between the subwoofer and ground.
8	Circuit 2-MD19 (GY/RD) subwoofer audio return	Less than 5 ohms between the subwoofer amplifier and the audio unit. Greater than 10,000 ohms between the subwoofer and ground.

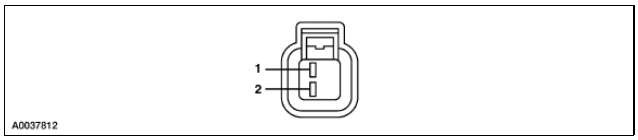
Subwoofer Amplifier C466b



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	Circuit 8-MD21 (WH/BU) right subwoofer speaker audio output	Less than 5 ohms between the right subwoofer speaker and the subwoofer amplifier. Greater than 10,000 ohms between the right subwoofer speaker and ground.
2	Circuit 10-MD21 (GY/VT) right subwoofer speaker audio return	Less than 5 ohms between the right subwoofer speaker and the subwoofer amplifier. Greater than 10,000 ohms between the right subwoofer speaker and ground.

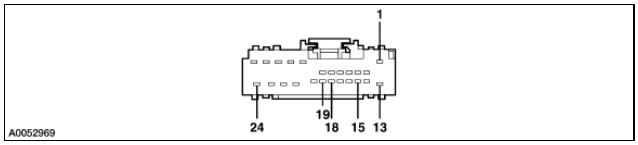
3	Circuit 8-MD22 (WH/GN) left subwoofer speaker audio output	Less than 5 ohms between the left subwoofer speaker and the subwoofer amplifier. Greater than 10,000 ohms between the left subwoofer speaker and ground.
4	Circuit 10-MD22 (GY/OG) left subwoofer speaker audio return	Less than 5 ohms between the left subwoofer speaker and the subwoofer amplifier. Greater than 10,000 ohms between the left subwoofer speaker and ground.

Speaker C523, C612, C702, C802



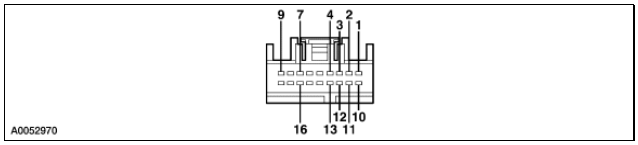
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1 (C523)	Circuit 8-MD10 (WH/BK) LF speaker audio output	Less than 5 ohms between the LF speaker and the audio unit. Greater than 10,000 ohms between the LF speaker and ground.
2 (C523)	Circuit 10-MD10 (GY/BK) LF speaker audio return	Less than 5 ohms between the LF speaker and the audio unit. Greater than 10,000 ohms between the LF speaker and ground.
1 (C612)	Circuit 8-MD17 (WH/RD) RF speaker audio output	Less than 5 ohms between the RF speaker and the audio unit. Greater than 10,000 ohms between the RF speaker and ground.
2 (C612)	Circuit 10-MD17 (GY/RD) RF speaker audio return	Less than 5 ohms between the RF speaker and the audio unit. Greater than 10,000 ohms between the RF speaker and ground.
1 (C702)	Circuit 8-MD11 (WH/VT) LR speaker audio output	Less than 5 ohms between the LR speaker and the audio unit. Greater than 10,000 ohms between the LR speaker and ground.
2 (C702)	Circuit 10-MD11 (GY/WH) LR speaker audio return	Less than 5 ohms between the LR speaker and the audio unit. Greater than 10,000 ohms between the LR speaker and ground.
1 (C802)	Circuit 8-MD18 (WH) RR speaker audio output	Less than 5 ohms between the RR speaker and the audio unit. Greater than 10,000 ohms between the RR speaker and ground.
2 (C802)	Circuit 10-MD18 (GY) RR speaker audio return	Less than 5 ohms between the RR speaker and the audio unit. Greater than 10,000 ohms between the RR speaker and ground.

VNR Audio Unit C2253a



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	Circuit 29-MD15 (OG/BK) B+ battery feed, audio unit memory	Greater than 10 volts between the audio unit and ground.
13	Circuit 31-MD15B (BK/GN) audio unit ground	Less than 5 ohms between the audio unit and ground.
15	Circuit 50-MD15 (GY/OG) B+ power feed START position only	Greater than 10 volts with key in START position.
18	Circuit 8-MD26 (WH/BK) steering wheel audio controls reference signal	Less than 5 ohms between the audio unit and the clockspring. Greater than 10,000 ohms between the audio unit and ground.
19	Circuit 31S-MD26 (BK/RD) steering wheel audio controls reference signal	Less than 5 ohms between the audio unit and the clockspring. Greater than 10,000 ohms between the audio unit and ground.
24	Circuit 31-MD15A (BK/GN) audio unit ground	Less than 5 ohms between the audio unit and ground.

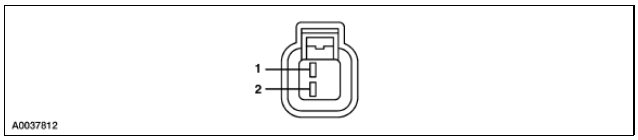
VNR Audio Unit C2253d



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	Circuit 8-MD10A (WH/BK) LF speaker output	Less than 5 ohms between the audio unit and the speaker and greater than 10,000 ohms between the audio unit and ground.
2	Circuit 8-MD17A (WH/RD) RF speaker output	Less than 5 ohms between the audio unit and the speaker and greater than 10,000 ohms between the audio unit and ground.
3	Circuit 8-MD11A (WH/VT) LR speaker output	Less than 5 ohms between the audio unit and the speaker and greater than 10,000 ohms between the audio unit and ground.
4	Circuit 8-MD18A (WH) RR speaker output	Less than 5 ohms between the audio unit and the speaker and greater than 10,000 ohms between the audio unit and ground.
7	Circuit 1-MD19 (WH/RD) subwoofer audio output	Less than 5 ohms between the audio unit and the subwoofer amplifier. Greater than 10,000 ohms between the audio unit and ground.
9	Circuit 7-MD27 (YE/VT) subwoofer enable/clip detection	Less than 5 ohms between the audio unit and the subwoofer amplifier. Greater than 10,000 ohms between the audio unit and ground.

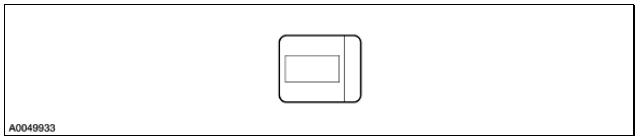
10	Circuit 10-MD10A (GY/BK) LF speaker return	Less than 5 ohms between the audio unit and the speaker and greater than 10,000 ohms between the audio unit and ground.
11	Circuit 10-MD17A (GY/RD) RF speaker return	Less than 5 ohms between the audio unit and the speaker and greater than 10,000 ohms between the audio unit and ground.
12	Circuit 10-MD11A (GY/WH) LR speaker return	Less than 5 ohms between the audio unit and the speaker and greater than 10,000 ohms between the audio unit and ground.
13	Circuit 10-MD18A (GY) RR speaker return	Less than 5 ohms between the audio unit and the speaker and greater than 10,000 ohms between the audio unit and ground.
16	Circuit 2-MD19 (GY/RD) subwoofer audio return	Less than 5 ohms between the audio unit and the subwoofer amplifier. Greater than 10,000 ohms between the audio unit and ground.

Subwoofer Speaker LH C4068, RH C4069



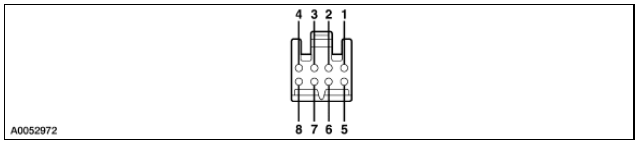
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1 (C4068)	Circuit 8-MD22 (WH/GN) left subwoofer speaker audio output	Less than 5 ohms between the left subwoofer speaker and the subwoofer amplifier. Greater than 10,000 ohms between the left subwoofer speaker and ground.
2 (C4068)	Circuit 10-MD22 (GY/OG) left subwoofer speaker audio return	Less than 5 ohms between the left subwoofer speaker and the subwoofer amplifier. Greater than 10,000 ohms between the left subwoofer speaker and ground.
1 (C4069)	Circuit 8-MD21 (WH/BU) right subwoofer speaker audio output	Less than 5 ohms between the right subwoofer speaker and the subwoofer amplifier. Greater than 10,000 ohms between the right subwoofer speaker and ground.
2 (C4069)	Circuit 10-MD21 (GY/VT) right subwoofer speaker audio return	Less than 5 ohms between the right subwoofer speaker and the subwoofer amplifier. Greater than 10,000 ohms between the right subwoofer speaker and ground.

Antenna Isolator Module C4194



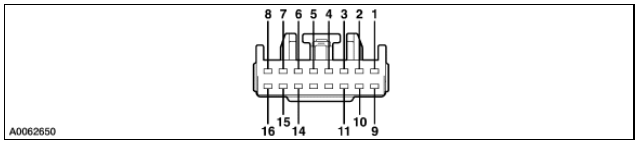
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	Circuit 29S-MD7 (OG/BU) B+ battery feed with the key in the ON and ACC positions	Greater than 10 volts between the antenna isolator module and ground.

Audio Amplifier C4208a



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	Circuit 10-MD18A (GY) RR speaker return	Less than 5 ohms between the audio unit and the audio amplifier and greater than 10,000 ohms between the audio amplifier audio unit and ground.
2	Circuit 10-MD17A (GY/RD) RF speaker return	Less than 5 ohms between the audio unit and the audio amplifier and greater than 10,000 ohms between the audio amplifier and ground.
3	Circuit 10-MD11A (GY/WH) LR speaker return	Less than 5 ohms between the audio unit and the audio amplifier and greater than 10,000 ohms between the audio amplifier and ground.
4	Circuit 10-MD10A (GY/BK) LF speaker return	Less than 5 ohms between the audio unit and the audio amplifier and greater than 10,000 ohms between the audio amplifier and ground.
5	Circuit 8-MD18A (WH) RR speaker output	Less than 5 ohms between the audio unit and the audio amplifier and greater than 10,000 ohms between the audio amplifier and ground.
6	Circuit 8-MD17A (WH/RD) RF speaker output	Less than 5 ohms between the audio unit and the audio amplifier and greater than 10,000 ohms between the audio amplifier and ground.
7	Circuit 8-MD11A (WH/VT) LR speaker output	Less than 5 ohms between the audio unit and the audio amplifier and greater than 10,000 ohms between the audio amplifier and ground.
8	Circuit 8-MD10A (WH/BK) LF speaker output	Less than 5 ohms between the audio unit and the audio amplifier and greater than 10,000 ohms between the audio amplifier and ground.

Audio Amplifier C4208b



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	Circuit 8-MD18 (WH) RR speaker output	Less than 5 ohms between the audio amplifier and the speaker and greater than 10,000 ohms between the audio amplifier and ground.
2	Circuit 10-MD18 (GY) RR speaker return	Less than 5 ohms between the audio amplifier and the speaker and greater than 10,000 ohms between the audio amplifier and ground.
3	Circuit 8-MD17 (WH/RD) RF speaker output	Less than 5 ohms between the audio amplifier and the speaker and greater than 10,000 ohms between the audio amplifier and ground.
4	Circuit 10-MD17 (GY/RD) RF speaker return	Less than 5 ohms between the audio amplifier and the speaker and greater than 10,000 ohms between the audio amplifier and ground.
5	Circuit 8-MD11 (WH/VT) LR speaker output	Less than 5 ohms between the audio amplifier and the speaker and greater than 10,000 ohms between the audio amplifier and ground.
6	Circuit 10-MD11 (GY/WH) LR speaker return	Less than 5 ohms between the audio amplifier and the speaker and greater than 10,000 ohms between the audio amplifier and ground.
7	Circuit 8-MD10 (WH/BK) LF speaker output	Less than 5 ohms between the audio amplifier and the speaker and greater than 10,000 ohms between the audio amplifier and ground.
8	Circuit 10-MD10 (GY/BK) LF speaker return	Less than 5 ohms between the audio amplifier and the speaker and greater than 10,000 ohms between the audio amplifier and ground.
9	Circuit 31-MD27A (BK/WH) audio amplifier ground	Less than 5 ohms between the audio amplifier and ground.
10	Circuit 31-MD27B (BK/WH) audio amplifier ground	Less than 5 ohms between the audio amplifier and ground.
11	Circuit 31-MD27C (BK/WH) audio amplifier ground	Less than 5 ohms between the audio amplifier and ground.
14	Circuit 30-MD27A (RD/WH) B+ battery feed	Greater than 10 volts between the audio amplifier and ground.
15	Circuit 30-MD27B (RD/WH) B+ battery feed	Greater than 10 volts between the audio amplifier and ground.
16	Circuit 30-MD27C (RD/WH) B+ battery feed	Greater than 10 volts between the audio amplifier and ground.

Pinpoint Test A: No Communication with the Audio Unit CDX6 and DM100i Only

Normal Operation

When the key is in the ON position and the audio unit is turned on, communication is possible between the diagnostic tool and the audio unit. The diagnostic tool retrieves codes and data.

Possible Causes

- central junction box (CJB) fuse(s):
  - ♦ 18 (20A)
  - ♦ 27 (10)
- battery junction box (BJB) fuse(s):
  - ♦ 22 (20A)
  - ♦ 25 (40A)
- standard corporate protocol (SCP) communication network
- circuit 4-EG7 (GY/RD) open or short to ground
- circuit 5-EG7 (BU/RD) open or short to ground
- circuit 4-EG10 (GY/BK) open or short to ground
- circuit 5-EG10 (BU/YE) open or short to ground
- circuit 29-MD15 (OG/BK) open or short to ground
- circuit 31-MD15A (BK/GN) open
- circuit 31-MD15B (BK/GN) open
- 75-MD15 (YE/GN) open
- audio unit

PINPOINT TEST A: NO COMMUNICATION WITH THE AUDIO UNIT CDX6 AND DM100i ONLY

Test Step	Result / Action to Take
A1 CHECK THE VOLTAGE TO THE AUDIO UNIT	
• Key in OFF position. • Disconnect: Audio Unit C240a and C240c (CDX6). • Disconnect: Audio Unit C290b and C290c (DM100i). • Key in ON position. • For CDX6, measure the voltage between the audio unit C240a-9, circuit 29-MD15 (OG/BK), harness side and ground; and between the audio unit C240a-10, circuit 75-MD15 (YE/GN), harness side and ground.  A0057101 • For DM100i, measure the voltage between the audio unit C290b-1, circuit 29-MD15 (OG/BK), harness side and ground; and between the audio unit C290b-2, circuit 75-MD15 (YE/GN), harness side and ground.	**Yes** GO to A2 . **No** REPAIR the circuit in question. REPEAT the data link diagnostic test.

 A0057102 • **Are the voltages greater than 10 volts?**	
A2 CHECK THE GROUND TO THE AUDIO UNIT	
• Key in OFF position. • For CDX6, measure the resistance between the audio unit C240a-11, circuit 31-MD15B (BK/GN), harness side and ground; and between the audio unit C240a-16, circuit 31-MD15A (BK/GN), harness side and ground.  A0057103 • For DM100i, measure the resistance between the audio unit C290b-13, circuit 31-MD15B (BK/GN), harness side and ground.  A0057104 • **Are the resistances less than 5 ohms?**	**Yes** GO to A3 . **No** REPAIR the circuit in question. REPEAT the data link diagnostic test.
A3 CHECK CIRCUIT 4-EG10 (GY/BK)/4-EG7 (GY/RD) FOR OPENS AND SHORTS TO GROUND	
• For CDX6, measure the resistance between the audio unit C240c-3, circuit 4-EG10 (GY/BK), harness side and the data link connector (DLC) C251-2, circuit 4-EG7 (GY/RD), harness side; and between the audio unit C240c-3, circuit 4-EG10 (GY/BK), harness side and ground.  A0057105 • For DM100i, measure the resistance between the audio unit C290c-1, circuit 4-EG10 (GY/BK), harness side and the DLC C251-2, circuit 4-EG7 (GY/RD), harness side; and between the audio unit C290c-1, circuit 4-EG10 (GY/BK), harness side and ground.	**Yes** GO to A4 . **No** REPAIR the circuit in question. REPEAT the data link diagnostic test.

 A0057106 • **Is the resistance less than 5 ohms between the audio unit and the DLC and greater than 10,000 ohms between the audio unit and ground?**	
A4 CHECK CIRCUITS 5-EG10 (BU/YE)/5-EG7 (BU/RD) FOR OPENS AND SHORTS TO GROUND	
• For CDX6, measure the resistance between the audio unit C240c-4, circuit 5-EG10 (BU/YE), harness side and the DLC C251-10, circuit 5-EG7 (BU/RD), harness side; and between the audio unit C240c-4, circuit 5-EG10 (BU/YE), harness side and ground.  A0067963 • For DM100i, measure the resistance between the audio unit C290c-4, circuit 5-EG10 (BU/YE), harness side and the DLC C251-10, circuit 5-EG7 (BU/RD), harness side; and between the audio unit C290c-4, circuit 5-EG10 (BU/YE), harness side and ground.  A0067963 • **Is the resistance less than 5 ohms between the audio unit and the DLC and greater than 10,000 ohms between the audio unit and ground?**	**Yes** REFER to Section 418-00 for further information. **No** REPAIR the circuit in question. REPEAT the data link diagnostic test.

Pinpoint Test B: The Audio Unit is Inoperative/Does Not Operate Correctly

Normal Operation

The audio unit is powered up when the ignition is in the ON or ACC position. The audio unit will provide audio signals to the speakers, subwoofer amplifier, and center imaging or audio amplifier (if equipped), thus producing sound.

Possible Causes

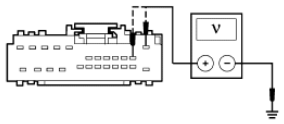
- central junction box (CJB) fuse(s):
  - 2 (5A)
  - 18 (20A)
  - 27 (10A)
- circuit 29-MD15 (OG/BK) open or short to ground
- circuit 31-MD15A, (BK/GN) open
- circuit 31-MD15B (BK/GN) open

- circuit 50-MD15 (GY/OG) short to power
- circuit 75-MD15 (YE/GN) open or short to ground
- audio unit

PINPOINT TEST B: THE AUDIO UNIT IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
B1 CHECK OPERATION OF THE AUDIO UNIT	
• Key in ON position. • Turn on the audio unit. • **Is the audio unit display illuminated?**	**Yes** GO to B2 . **No** GO to B4 .
B2 CHECK FOR SOUND COMING FROM THE SPEAKERS	
• Carry out the speaker walk-around test by pressing preset buttons 3 and 6 simultaneously. • Check for sound from the speakers. • **Is sound coming from the speakers?**	**Yes** GO to B3 . **No** Go To Pinpoint Test H .
B3 CARRY OUT CONTROLS AND FEATURES TEST	
• Verify that all the audio system controls and features operate correctly; refer to the owner literature. • **Do all the controls and features operate correctly?**	**Yes** The system is OK. **No** REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Audio Unit in this section. TEST the system for normal operation.
B4 CHECK THE VOLTAGE TO THE AUDIO UNIT	
• Key in OFF position. • Disconnect: Audio Unit C240a (CDX6). • Disconnect: Audio Unit C290b (DM100i). • Disconnect: Audio Unit C2253a (VNR). • Key in ON position. • For CDX6, measure the voltage between the audio unit C240a-9, circuit 29-MD15 (OG/BK), harness side and ground; and between the audio unit C240a-10, circuit 75-MD15 (YE/GN), harness side and ground.  • For DM100i or VNR, measure the voltage between the audio unit and ground as follows:	**Yes** GO to B5 . **No** REPAIR the circuit in question. TEST the system for normal operation.

Audio Unit	Connector-Pin	Circuit
DM100i	C290b-1	Circuit 29-MD15 (OG/BK)
DM100i	C290b-2	75-MD15 (YE/GN)
VNR	C2253a-1	29-MD15 (OG/BK)

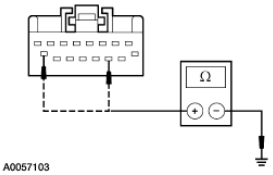


A0065069

- **Are the voltages greater than 10 volts?**

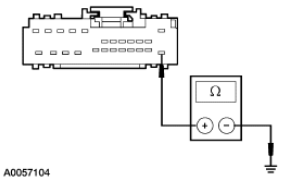
B5 CHECK THE GROUND TO THE AUDIO UNIT

- Key in OFF position.
- For CDX6, measure the resistance between the audio unit C240a-11, circuit 31-MD15B (BK/GN), harness side and ground; and between the audio unit C240a-16, circuit 31-MD15A (BK/GN), harness side and ground.



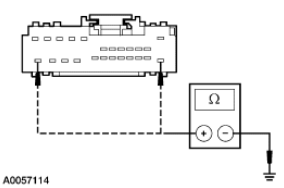
A0057103

- For DM100i, measure the resistance between the audio unit C290b-13, circuit 31-MD15B (BK/GN), harness side and ground.



A0057104

- For VNR, measure the resistance between the audio unit C2253a-13, circuit 31-MD15B (BK/GN), harness side and ground; and between the audio unit C2253a-24, circuit 31-MD15A (BK/GN), harness side and ground.



A0057114

- **Are the resistances less than 5 ohms?**

Yes
GO to B6 .

No
REPAIR the circuit in question. TEST the system for normal operation.

B6 CHECK CIRCUIT 50-MD15 (GY/OG) FOR SHORT TO POWER WITH KEY IN ACC POSITION	
• Key in ACCESSORY position. • Measure the voltage between audio unit C240a-3 (CDX6), C290b-15 (DM100i), or C2253a-15 (VNR), circuit 50-MD15 (GY/OG), harness side and ground.  • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Audio Unit in this section. TEST the system for normal operation.

Pinpoint Test C: Poor Reception

Normal Operation

The radio suppression equipment reduces interference transmitted through the speakers by the engine ignition and electrical systems.

Possible Causes

- antenna
- antenna connections
- noise suppression equipment
- antenna isolator module
- audio unit

PINPOINT TEST C: POOR RECEPTION

Test Step	Result / Action to Take
C1 CHECK THE RADIO SIGNAL RECEPTION	
• Check the audio unit signal reception with both the engine running and with the engine off. • **Is the audio unit signal reception noisy only with the engine running?**	**Yes** GO to C2 . **No** GO to C8 .
C2 CHECK SUPPRESSION EQUIPMENT	
• Check all required suppression equipment, radio frequency interference suppression bond, and the hood bonding strap for security, cleanliness, and metal-to-metal contact.	**Yes** GO to C3 . **No** INSTALL new radio frequency interference suppression bonds or related equipment. CLEAN or SECURE the connections as necessary. TEST the system for normal operation.

• **Are the contacts clean, secure, and in metal-to-metal contact?**	
C3 CHECK THE CAPACITOR MOUNTING AND CONNECTING CIRCUITS	
NOTE: The capacitor mounting points are used to complete the electrical circuit and must be mounted securely to clean surfaces. • Check the mounting and connecting circuits of the radio ignition interference capacitor(s) for security, cleanliness, and metal-to-metal contact. Refer to Antenna in this section. • **Are the contacts clean, secure, and in metal-to-metal contact?**	**Yes** GO to C4 . **No** CLEAN or SECURE the connections as necessary. TEST the system for normal operation.
C4 CHECK THE RADIO IGNITION INTERFERENCE CAPACITOR(S) AND THE GENERATOR	
• Check the operation of the radio ignition interference capacitor(s) by installing known good component(s). • Check the generator by disconnecting the wiring harness from the voltage regulator. • Key in START position. • Check the operation of the audio unit. • **Is the noise eliminated?**	**Yes** REPAIR or INSTALL new components as necessary. TEST the system for normal operation. **No** GO to C5 .
C5 CHECK THE IGNITION CIRCUITS	
• Key in OFF position. • Check the ignition circuits for correct routing, grounding, and security of connections. • **Are the circuits OK?**	**Yes** GO to C6 . **No** REPAIR the circuit as necessary. TEST the system for normal operation.
C6 CHECK THE IGNITION SYSTEM	
• Test the ignition system; refer to Section 303-04A (3.0L 4V) or Section 303-04B (3.9L). • **Is the ignition system OK?**	**Yes** GO to C7 . **No** REPAIR the ignition system. REFER to Section 303-07. TEST the system for normal operation.
C7 SUBSTITUTE THE AUDIO UNIT	
• Key in OFF position. • Substitute a known good audio unit. • Key in START position. • Check the operation of the audio unit. • **Is the noise eliminated?**	**Yes** REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Audio Unit in this section. TEST the system for normal operation. **No**

	REINSTALL the original audio unit. USE a jumper cable to ground various parts of the vehicle to the frame (for example: engine, fenders, quarter panels, stone deflectors, air cleaner, body sheet metal). When the noise is eliminated, PROVIDE a permanent ground where necessary. TEST the system for normal operation.
C8 CHECK ANTENNA FOR DAMAGE	
• Key in OFF position. • Disconnect: Antenna Lead Terminal. • Measure the resistance between the antenna cable lead terminal and the end of the antenna grid wire. • **Is the resistance less than 8 ohms?**	**Yes** GO to C9 . **No** REPAIR the antenna. REFER to Antenna in this section.
C9 CHECK VOLTAGE TO ANTENNA ISOLATOR MODULE	
• Disconnect: Antenna Isolator Module C4194. • Key in ON position. • Measure the voltage between the antenna isolator module C4194, circuit 29S-MD7 (OG/BU), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to C10 . **No** REPAIR the circuit. TEST the system for normal operation.
C10 SUBSTITUTE ANTENNA ISOLATOR MODULE	
• Key in OFF position. • Substitute a known good antenna isolator module. • Key in START position. • Check the operation of the audio unit. • **Is the noise eliminated?**	**Yes** INSTALL a new antenna isolator module. REFER to Antenna in this section. TEST the system for normal operation. **No** GO to C11 .
C11 SUBSTITUTE ANTENNA EXTENSION CABLE(S)	
• Key in OFF position. • Substitute a known good antenna cable(s) between the antenna isolator module and the audio unit. • Key in START position. • Check the operation of the audio unit. • **Is the noise eliminated?**	**Yes** INSTALL a new antenna cable. REFER to Antenna in this section. TEST the system for normal operation. **No** REINSTALL the original antenna cable. REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Audio Unit in this section. TEST the system for normal operation.

Pinpoint Test D: Poor Quality/Distorted Sound or No Sound from one or more Speakers (Not All Speakers) DM100i

Normal Operation

The audio unit directs the audio signals to the speakers through separate positive and negative circuits for each of the four audio channels LF, RF, LR, and RR. The audio unit provides internal circuit protection for shorts to ground, shorts to B+ battery or shorts between any output circuits.

Possible Causes

- speakers
- audio unit
- high resistance or short to ground in speaker circuits

PINPOINT TEST D: POOR QUALITY/DISTORTED SOUND OR NO SOUND FROM ONE OR MORE SPEAKERS (NOT ALL SPEAKERS) DM100i

Test Step	Result / Action to Take
D1 CHECK FOR SOUND	
• Key in ON position. • Turn on the audio unit. • Carry out the speaker walk-around test by pressing preset buttons 3 and 6 simultaneously. • **Do all speakers have poor quality/distorted sound or no sound?**	**Yes** SEND the audio unit to an authorized audio system repair facility. TEST the system for normal operation. **No** GO to D2 .
D2 CHECK FOR AN AUDIO SIGNAL OUTPUT TO THE SPEAKER WITH POOR QUALITY/DISTORTED SOUND OR NO SOUND	
• Key in OFF position. • Disconnect: Speaker(s) with poor quality/distorted sound or no sound. • Key in ON position. • Turn on the audio unit. • Measure the voltage between pin 1 and pin 2 of the speaker with poor quality/distorted sound or no sound.  A0057116 • **Is there a fluctuating AC voltage?**	**Yes** INSTALL a new speaker. REFER to Door Speaker in this section. TEST the system for normal operation. **No** GO to D3 .
D3 CHECK THE CIRCUITS BETWEEN THE SPEAKER(S) AND THE AUDIO UNIT FOR OPENS AND SHORTS TO GROUND	

- Key in OFF position.
- Disconnect: Audio Unit C290b.
- Disconnect: Inoperative Audio Speaker(s).
- Measure the resistance between the speaker with poor quality/distorted sound and the audio unit, and between the audio unit and ground as follows:

Speaker	Speaker Pin	Audio Unit Pin	Circuit
LF C523	1	8	8-MD10 (WH/BK)
LF C523	2	21	10-MD10 (GY/BK)
RF C612	1	11	8-MD17 (WH/RD)
RF C612	2	12	10-MD17 (GY/RD)
LR C702	1	9	8-MD11 (WH/VT)
LR C702	2	22	10-MD11 (GY/WH)
RR C802	1	10	8-MD18 (WH)
RR C802	2	23	10-MD18 (GY)

- **Are the resistance(s) less than 5 ohms between the speaker connector(s) and the audio unit, and greater than 10,000 ohms between the audio unit connector and ground?**

Yes
REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Audio Unit in this section. TEST the system for normal operation.

No
REPAIR the circuit in question. TEST the system for normal operation.

Pinpoint Test E: Poor Quality/Distorted Sound or No Sound From One or More Speakers (Not All Speakers) CDX6

Normal Operation

The audio unit directs the audio signals to the speakers through separate positive and negative circuits for each of the four audio channels LF, RF, LR, and RR. The audio unit also directs the audio signals to the center imaging amplifier. The signals are then amplified by the center imaging amplifier and sent to both of the center imaging speakers. The audio unit provides internal circuit protection for shorts to ground, shorts to B+ battery or shorts between any output circuits.

Possible Causes

- central junction box (CJB) fuse 18 (20A)
- battery junction box (BJB) fuse 25 (40A)
- speaker(s)
- audio unit
- center imaging amplifier
- speaker circuit(s) open or short to ground

PINPOINT TEST E: POOR QUALITY/DISTORTED SOUND OR NO SOUND FROM ONE OR MORE SPEAKERS (NOT ALL SPEAKERS) CDX6

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>E1 CHECK FOR SOUND</td><td></td></tr>
<tr><td>• Key in ON position.
• Turn on the audio unit.
• Carry out the speaker walk-around test by pressing preset buttons 3 and 6 simultaneously.
• Do all speakers have poor quality/distorted sound or no sound?</td><td>Yes
SEND the audio unit to an authorized audio system repair facility. TEST the system for normal operation.

No
If one or more of the door speakers is inoperative GO to E2 .

If one or more center imaging speakers is inoperative, GO to E4 .</td></tr>
<tr><td>E2 CHECK FOR AN AUDIO SIGNAL OUTPUT TO THE SPEAKER WITH POOR QUALITY/DISTORTED SOUND OR NO SOUND</td><td></td></tr>
<tr><td>• Key in OFF position.
• Disconnect: Speaker(s) with poor quality/distorted sound or no sound.

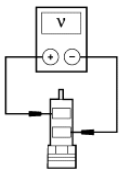
LR C702	2	13	10-MD11 (GY/WH)
RR C802	1	5	8-MD18 (WH)
RR C802	2	6	10-MD18 (GY)

- **Are the resistance(s) less than 5 ohms between the speaker connector(s) and the audio unit, and greater than 10,000 ohms between the audio unit connector and ground?**

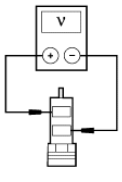
E4 CHECK THE CENTER IMAGING SPEAKER OPERATION	
• Key in ON position. • Turn the audio unit on. • Check the operation of the center imaging speakers. • **Are both center imaging speakers inoperative?**	**Yes** GO to E5 . **No** GO to E12 .
E5 CHECK CIRCUIT 7-MD12 (YE) FOR POWER	
• Key in OFF position. • Disconnect: Center Imaging Amplifier C225. • Key in ON position. • Turn on the audio unit. • Measure the voltage between the center imaging amplifier C225-13, circuit 7-MD12 (YE), harness side and ground.  • **Is any voltage present?**	**Yes** GO to E6 . **No** GO to E11 .
E6 CHECK CIRCUIT 29-MD12 (OG/YE) FOR VOLTAGE	
• Measure the voltage between the center imaging amplifier C225-16, circuit 29-MD12 (OG/YE), harness side and ground.	**Yes** GO to E7 . **No** REPAIR the circuit. TEST the system for normal operation.

 A0057118 • **Is the voltage greater than 10 volts?**	
E7 CHECK GROUND CIRCUIT 31-MD12 (BK/YE) FOR OPEN	
• Key in OFF position. • Measure the resistance between the center imaging amplifier C225-15, circuit 31-MD12 (BK/YE), harness side and ground.  A0057119 • **Is the resistance less than 5 ohms?**	**Yes** GO to E8 . **No** REPAIR the circuit. TEST the system for normal operation.
E8 CHECK FOR AN AUDIO SIGNAL OUTPUT TO THE AMPLIFIER	
• Measure the voltage between the center imaging amplifier C225-1, circuit 1-MD12 (WH), harness side and the center imaging amplifier C225-2, circuit 2-MD12 (GY), harness side.  A0065070 • **Is there a fluctuating AC voltage?**	**Yes** INSTALL a new center imaging amplifier. REFER to Audio Unit Amplifier Center Imaging in this section. TEST the system for normal operation. **No** GO to E9 .
E9 CHECK CIRCUIT 1-MD12 (WH) FOR OPEN OR SHORT TO GROUND	
• Disconnect: Audio Unit C240b. • Measure the resistance between the center imaging amplifier C225-1, circuit 1-MD12 (WH), harness side and the audio unit C240b-6, circuit 1-MD12 (WH), harness side; and between the center imaging amplifier C225-1, circuit 1-MD12 (WH), harness side and ground.  A0062663	**Yes** GO to E10 . **No** REPAIR the circuit. TEST the system for normal operation.

• **Is the resistance less than 5 ohms between the center imaging amplifier and the audio unit, and greater than 10,000 ohms between the center imaging amplifier and ground?**	
E10 CHECK CIRCUIT 2-MD12 (GY) FOR OPEN OR SHORT TO GROUND	
• Measure the resistance between the center imaging amplifier C225-2, circuit 2-MD12 (GY), harness side and the audio unit C240b-5, circuit 2-MD12 (GY), harness side; and between the center imaging amplifier C225-2, circuit 2-MD12 (GY), harness side and ground.  • **Is the resistance less than 5 ohms between the center imaging amplifier and the audio unit, and greater than 10,000 ohms between the center imaging amplifier and ground?**	**Yes** REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Audio Unit in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
E11 CHECK CIRCUIT 7-MD12 (YE) FOR OPEN	
• Key in OFF position. • Disconnect: Audio Unit C240b. • Measure the resistance between the center imaging amplifier C225-13, circuit 7-MD12 (YE), harness side and the audio unit C240b-8, circuit 7-MD12 (YE), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Audio Unit in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
E12 CHECK FOR AN AUDIO SIGNAL OUTPUT TO THE INOPERATIVE CENTER IMAGING SPEAKER	
• Disconnect: Inoperative Center Imaging Speaker. • Key in ON position. • For the LH center imaging speaker, measure the voltage between the center imaging speaker C230-1, circuit 8-MD30 (WH/BU), harness side and C230-2, circuit 10-MD30 (GY/VT), harness side.	**Yes** INSTALL a new center imaging speaker. REFER to Audio Unit Amplifier Center Imaging in this section. TEST the system for normal operation. **No** GO to E13 .



- For the RH center imaging speaker, measure the voltage between the center imaging speaker C231-1, circuit 8-MD31 (WH/GN), harness side and C231-2, circuit 10-MD31 (GY/OG), harness side.



- **Is there a fluctuating AC voltage?**

E13 CHECK THE AUDIO SIGNAL CIRCUITS TO THE INOPERATIVE CENTER IMAGING SPEAKER FOR OPENS AND SHORT TO GROUND

- Key in OFF position.
- Disconnect: Center Imaging Amplifier C225.
- Measure the resistance between the inoperative center imaging speaker and the center imaging amplifier, and between the center imaging amplifier and ground in the following groups:

Speaker	Amplifier Pin	Center Imaging Speaker Pin	Circuit
LH C230	7	1	8-MD30 (WH/BU)
LH C230	8	2	10-MD30 (GY/VT)
RH C231	5	1	8-MD31 (WH/GN)
RH C231	6	2	10-MD31 (GY/OG)

- **Is the resistance less than 5 ohms between the center imaging amplifier and the inoperative center imaging speaker, and greater than 10,000 ohms between the center imaging amplifier and ground?**

Yes
INSTALL a new center imaging amplifier. REFER to Audio Unit Amplifier Center Imaging in this section. TEST the system for normal operation.

No
REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test F: Poor Quality/Distorted Sound or No Sound From One or More Speakers (Not All Speakers) Vehicle Navigation Radio (VNR)

Normal Operation

The audio unit directs the audio signals to the audio amplifier through separate positive and negative circuits for each of the four audio channels LF, RF, LR, and RR. The signals are then amplified by the audio amplifier and sent to the four door speakers. The audio unit provides internal circuit protection for shorts to ground, shorts to B+ battery or shorts between any output circuits.

Possible Causes

- speaker(s)
- audio unit
- audio amplifier
- speaker circuit(s) open or short to ground

PINPOINT TEST F: POOR QUALITY/DISTORTED SOUND OR NO SOUND FROM ONE OR MORE SPEAKERS (NOT ALL SPEAKERS) VEHICLE NAVIGATION RADIO (VNR)

Test Step	Result / Action to Take
F1 CHECK FOR SOUND	
• Key in ON position. • Turn on the audio unit. • Carry out the speaker walk-around test by pressing the map dest buttons simultaneously. • **Do all four speakers have poor quality/distorted sound or no sound?**	**Yes** GO to F6 . **No** GO to F2 .
F2 CHECK FOR AN AUDIO SIGNAL OUTPUT TO THE SPEAKER WITH POOR QUALITY/DISTORTED SOUND OR NO SOUND	
• Key in OFF position. • Disconnect: Speaker(s) with poor quality/distorted sound or no sound. • Key in ON position. • Turn on the audio unit. • Measure the voltage between pin 1 and pin 2 of the speaker with poor quality/distorted sound or no sound.  A0057116 • **Is there a fluctuating AC voltage?**	**Yes** INSTALL a new speaker. REFER to Door Speaker in this section. TEST the system for normal operation. **No** GO to F3 .
F3 CHECK THE CIRCUITS BETWEEN THE SPEAKER(S) AND THE AUDIO AMPLIFIER	

- Key in OFF position.
- Disconnect: Audio Amplifier C4208b.
- Disconnect: Inoperative Audio Speaker(s).
- Measure the resistance between the speaker with poor quality/distorted sound and the audio amplifier C4208b, and between the audio amplifier C4208b and ground as follows:

Speaker	Speaker Pin	Audio Amplifier Pin	Circuit
LF C523	1	7	8-MD10 (WH/BK)
LF C523	2	8	10-MD10 (GY/BK)
RF C612	1	3	8-MD17 (WH/RD)
RF C612	2	4	10-MD17 (GY/RD)
LR C702	1	5	8-MD11 (WH/VT)

- **Are the resistance(s) less than 5 ohms between the speaker connector(s) and the audio amplifier, and greater than 10,000 ohms between the audio amplifier connector and ground?**

Yes
GO to F4 .

No
REPAIR the circuit in question. TEST the system for normal operation.

F4 CHECK FOR AN AUDIO OUTPUT SIGNAL TO THE AUDIO AMPLIFIER

- Key in OFF position.
- Disconnect: Audio Amplifier C4208a.
- Key in ON position.
- With the audio unit on, check for a fluctuating AC voltage (at the audio amplifier) between the signal circuits corresponding to the speaker with poor quality/distorted sound or no sound as follows:

Speaker	Audio Amplifier C4208a Pin	Audio Amplifier C4208a Pin
LF	4	8
RF	2	6
LR	7	3

Yes
INSTALL a new audio amplifier. REFER to Audio Unit Amplifier VNR in this section. TEST the system for normal operation.

No
GO to F5 .

RR	1	5

- **Is there a fluctuating AC voltage corresponding to the speaker with poor quality/distorted sound or no sound?**

F5 CHECK THE CIRCUITS BETWEEN THE AUDIO UNIT AND THE AUDIO AMPLIFIER

- Key in OFF position.
- Disconnect: Audio Unit C2253d.
- Measure the resistance between the audio unit and the audio amplifier C4208a, corresponding to the speaker that has poor quality/distorted sound or no sound, as follows:

Speaker	Audio Unit Pin	Audio Amplifier Pin	Circuit
LF	10	4	10-MD10A (GY/BK)
LF	11	2	10-MD17A (GY/RD)
RF	12	3	10-MD11A (GY/WH)
RF	13	1	10-MD18A (GY)
LR	1	8	8-MD10A (WH/BK)
LR	2	6	8-MD17A (WH/RD)
RR	3	7	8-MD11A (WH/VT)
RR	13	4	8-MD18A (WH)

- **Are the resistance(s) less than 5 ohms between the audio unit and the audio amplifier, and greater than 10,000 ohms between the audio amplifier connector and ground?**

Yes
REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Audio Unit in this section. TEST the system for normal operation.

No
REPAIR the circuit in question. TEST the system for normal operation.

F6 CHECK FOR POWER TO THE AUDIO AMPLIFIER

- Key in OFF position.
- Disconnect: Audio Amplifier C4208b.
- Key in ON position.
- Measure the voltage between the audio amplifier C4208b-14, circuit 30-MD27A (RD/WH), C4208b-15, circuit 30-MD27B (RD/WH), C4208b-16, circuit 30-MD27C (RD/WH), harness side and ground.

Yes
GO to F7 .

No
REPAIR the circuit. TEST the system for normal operation.

 • **Is the voltage greater than 10 volts?**	
F7 CHECK FOR CORRECT GROUND FOR THE AUDIO AMPLIFIER	
• Key in OFF position. • Measure the resistance between the audio amplifier C4208b-9, circuit 31-MD27A (BK/WH), C4208b-10, circuit 31-MD27B (BK/WH), C4208b-11, circuit 31-MD27C (BK/WH), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new audio amplifier. REFER to Audio Unit Amplifier VNR in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test G: The Subwoofer is Inoperative CDX6 and Vehicle Navigation Radio (VNR) Only

Normal Operation

The subwoofer speakers are powered from a separate subwoofer amplifier. The clip detection circuit, 7-MD19 (YE/RD), carries out two functions: to turn on the subwoofer amplifier, and to indicate to the audio unit when the subwoofer output distortion signal reaches a damaging level. The audio unit then reduces the audio output signal to the subwoofer amplifier.

Possible Causes

- subwoofer amplifier
- subwoofer speaker(s)
- audio unit
- circuit 1-MD19 (WH/RD) open or short to ground
- circuit 2-MD19 (GY/RD) open or short to ground
- circuit 7-MD19 (YE/RD) open or short to ground
- circuit 7-MD27 (YE/VT) open or short to ground
- circuit 8-MD21 (WH/BU) open or short to ground
- circuit 8-MD22 (WH/GN) open or short to ground
- circuit 10-MD21 (GY/VT) open or short to ground
- circuit 10-MD22 (GY/OG) open or short to ground
- circuit 30-MD19A (RD/BU) open or short to ground
- circuit 31-MD19 (BK/BU) open

PINPOINT TEST G: THE SUBWOOFER IS INOPERATIVE CDX6 AND VEHICLE NAVIGATION RADIO (VNR) ONLY

Test Step	Result / Action to Take
G1 CHECK THE SUBWOOFER OPERATION	
• Key in ON position. • Turn the audio unit on. • Check the operation of the subwoofer speakers. • **Are both subwoofer speakers inoperative?**	**Yes** GO to G2 . **No** GO to G9 .
G2 CHECK CIRCUIT 7-MD19 (YE/RD) FOR POWER	
• Key in OFF position. • Disconnect: Subwoofer Amplifier C466a. • Key in ON position. • Turn the audio unit on. • Measure the voltage between the subwoofer amplifier C466a-1, circuit 7-MD19 (YE/RD), harness side and ground.  A0057127 • **Is any voltage present?**	**Yes** GO to G3 . **No** GO to G8 .
G3 CHECK CIRCUIT 30-MD19A (RD/BU) FOR VOLTAGE	
• Measure the voltage between the subwoofer amplifier C466a-5, circuit 30-MD19A (RD/BU), harness side and ground.  A0057128 • **Is the voltage greater than 10 volts?**	**Yes** GO to G4 . **No** REPAIR the circuit. TEST the system for normal operation.
G4 CHECK GROUND CIRCUIT 31-MD19 (BK/BU)	
• Key in OFF position. • Measure the resistance between the subwoofer amplifier C466a-2, circuit 31-MD19 (BK/BU), harness side and ground.  A0057129 • **Is the resistance less than 5 ohms?**	**Yes** GO to G5 . **No** REPAIR the circuit. TEST the system for normal operation.
G5 CHECK FOR AN AUDIO SIGNAL OUTPUT TO THE	

AMPLIFIER	
• Measure the voltage between the subwoofer amplifier C466a-7, circuit 1-MD19 (WH/RD), harness side and the subwoofer amplifier C466a-8, circuit 2-MD19 (GY/RD), harness side.  A0057130 • **Is there a fluctuating AC voltage?**	**Yes** INSTALL a new subwoofer amplifier. REFER to Subwoofer Amplifier in this section. TEST the system for normal operation. **No** GO to G6 .
G6 CHECK CIRCUIT 1-MD19 (WH/RD)	
• Disconnect: Audio Unit C240b (CDX6). • Disconnect: Audio Unit C2253d (VNR). • For CDX6, measure the resistance between the subwoofer amplifier C466a-7, circuit 1-MD19 (WH/RD), harness side and the audio unit C240b-2, circuit 1-MD19 (WH/RD), harness side; and between the subwoofer amplifier C466a-7, circuit 1-MD19 (WH/RD), harness side and ground.  A0057131 • For VNR, measure the resistance between the subwoofer amplifier C466a-7, circuit 1-MD19 (WH/RD), harness side and the audio unit C2253d-7, circuit 1-MD19 (WH/RD), harness side; and between the subwoofer amplifier C466a-7, circuit 1-MD19 (WH/RD), harness side and ground.  A0059762 • **Is the resistance less than 5 ohms between the subwoofer amplifier and the audio unit, and greater than 10,000 ohms between the subwoofer amplifier and ground?**	**Yes** GO to G7 . **No** REPAIR the circuit. TEST the system for normal operation.
G7 CHECK CIRCUIT 2-MD19 (GY/RD)	
• For CDX6, measure the resistance between the subwoofer amplifier C466a-8, circuit 2-MD19 (GY/RD), harness side and the audio unit C240b-1, circuit 2-MD19 (GY/RD), harness side; and between the subwoofer amplifier C466a-8, circuit 2-MD19 (GY/RD), harness side and ground.	**Yes** REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Audio Unit in this section. TEST the system

 A0057133 • For VNR, measure the resistance between the subwoofer amplifier C466a-8, circuit 2-MD19 (GY/RD), harness side and the audio unit C2253d-16, circuit 2-MD19 (GY/RD), harness side; and between the subwoofer amplifier C466a-8, circuit 2-MD19 (GY/RD), harness side and ground.  A0057134 • **Is the resistance less than 5 ohms between the subwoofer amplifier and the audio unit, and greater than 10,000 ohms between the subwoofer amplifier and ground?**	for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
G8 CHECK THE ENABLE CIRCUIT FOR AN OPEN	
• Key in OFF position. • Disconnect: Audio Unit C240b (CDX6). • Disconnect: Audio Unit C2253d (VNR). • For CDX6, measure the resistance between the subwoofer amplifier C466a-1, circuit 7-MD19 (YE/RD), harness side and the audio unit C240b-4, circuit 7-MD19 (YE/RD), harness side.  A0057135 • For VNR, measure the resistance between the subwoofer amplifier C466a-1, circuit 7-MD19 (YE/RD), harness side and the audio unit C2253d-9, circuit 7-MD27 (YE/VT), harness side.  A0057136 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new subwoofer amplifier. REFER to Subwoofer Amplifier in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
G9 CHECK FOR AN AUDIO SIGNAL OUTPUT TO THE INOPERATIVE SUBWOOFER SPEAKER	

• Disconnect: Inoperative Subwoofer Speaker. • Key in ON position. • For the left hand subwoofer speaker, measure the voltage between the subwoofer speaker C4068-1, circuit 8-MD22 (WH/GN), harness side and C4068-2, circuit 10-MD22 (GY/OG), harness side.  A0057116 • For the right hand subwoofer speaker, measure the voltage between the subwoofer speaker C4069-1, circuit 8-MD21 (WH/BU), component side and C4069-2, circuit 10-MD21 (GY/VT), component side.  A0057116 • **Is there a fluctuating AC voltage?**	**Yes** INSTALL a new subwoofer speaker. TEST the system for normal operation. **No** GO to G10 .
G10 CHECK AUDIO SIGNAL CIRCUITS FOR OPENS AND SHORTS TO GROUND	
• Disconnect: Subwoofer Amplifier C466b. • Measure the resistance between the inoperative subwoofer speaker and the subwoofer amplifier, and between the subwoofer amplifier and ground as follows: **Speaker** / **Speaker Pin** / **Subwoofer Amplifier Pin** / **Circuit** LH C4068 / 1 / 3 / 8-MD22 (WH/GN) LH C4068 / 2 / 4 / 10-MD22 (GY/OG) RH C4069 / 1 / 1 / 8-MD21 (WH/BU) RH C4069 / 2 / 2 / 10-MD21 (GY/VT) • **Is the resistance between the inoperative subwoofer speaker and the subwoofer amplifier less than 5 ohms, and greater than 10,000 ohms between the subwoofer amplifier and ground?**	**Yes** INSTALL a new subwoofer amplifier. REFER to Subwoofer Amplifier in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test H: The Auxiliary Audio Control Is Inoperative/Does Not Operate Correctly Steering Wheel Control Switches

Normal Operation

The steering wheel audio control consists of a specific resistor value for each button function creating a voltage divider. When a button is pressed, a specific voltage is sent to the audio unit. The audio unit the uses the reference voltage to determine which input function has been selected. Circuit 8-MD26 (WH/BK) is the reference voltage circuit between the steering wheel audio controls and the audio unit.

Possible Causes

- steering wheel control switches
- audio unit
- clock spring
- circuit 8-MD26 (WH/BK) open or shorted to ground
- circuit 31S-PG24 (BK/OG) open
- powertrain control module (PCM)

PINPOINT TEST H: THE AUXILIARY AUDIO CONTROL IS INOPERATIVE/DOES NOT OPERATE CORRECTLY STEERING WHEEL CONTROL SWITCHES

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>H1 CHECK THE STEERING WHEEL AUDIO CONTROL SWITCH RESISTANCES</td><td></td></tr>
<tr><td>• Key in OFF position.
• Disconnect: Audio Unit C240c (CDX6).
• Disconnect: Audio Unit C290b (DM100i).
• Disconnect: Audio Unit C2253a (VNR).
• Key in ON position.
• While pressing the steering wheel control switches, measure the resistance between the audio unit, C240c-14 (CDX6), circuit 8-MD26 (WH/BK), harness side and ground; or between the audio unit C290b-18 (DM100I), circuit 8-MD26 (WH/BK) harness side and the audio unit C290b-19 circuit 31S-MD26 (BK/RD), harness side; or between the audio unit C2253a-18 (VNR), circuit 8-MD26 (WH/BK), harness side and the audio unit C290b-19 , circuit 31S-MD26 (BK/RD), harness side.

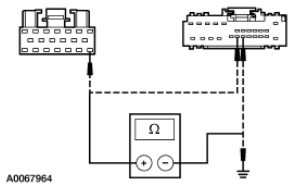
REMOVE the audio unit and SEND it to an authorized audio system repair facility.

No
GO to H2 .</td></tr>
</table>



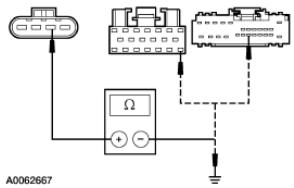
- **Are the resistances within specifications?**

H2 CHECK CIRCUIT 8-MD26 (WH/BK) FOR AN OPEN OR A SHORT TO GROUND

NOTE: Before disconnecting the steering wheel audio control switches, deactivate the air bags. Refer to Section 501-20B .

- Key in OFF position.
- Disconnect: Steering Wheel Audio Control Switch Connector.
- Measure the resistance between the steering wheel audio control switch connector pin 2, circuit 8-MD26 (WH/BK), harness side and ground; and between the steering wheel audio control switch connector pin 2, circuit 8-MD26 (WH/BK), harness side and the audio unit as follows.

Audio Unit	Connector-Pin	Circuit
CDX6	C240c-14	8-MD26
DM100i	C290b-18	8-MD26
VNR	C2253a-18	8-MD26



- **Is the resistance greater than 10,000 ohms between the steering wheel audio control switch and ground; and less than 5 ohms between the steering wheel audio control switch and the audio unit?**

Yes
GO to H4 .

No
GO to H3

H3 CHECK CIRCUIT 8-MD26 (WH/BK) FROM THE CLOCKSPRING TO THE AUDIO UNIT

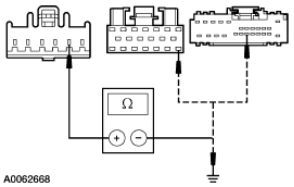
- Disconnect: Clockspring C218b.
- Measure the resistance between the clockspring C218b-2, circuit 8-MD26 (WH/BK), harness side and ground; and between the clockspring C218b-2, circuit 8-MD26 (WH/BK), harness side and the audio unit as follows.

Audio Unit	Connector-Pin	Circuit
CDX6	C240c-14	8-MD26

Yes
INSTALL a new clockspring REFER to Section 501-20B . TEST the system for normal operation.

No
REPAIR circuit 8-MD26 (WH/BK). TEST the system for normal operation.

DM100i	C290b-18	8-MD26
VNR	C2253a-18	8-MD26



- **Is the resistance greater than 10,000 ohms between the steering wheel control switch and ground; and less than 5 ohms between the steering wheel control switch and the audio unit?**

H4 CHECK CIRCUIT 31S-PG24 (BK/OG) FOR AN OPEN	
NOTE: Before disconnecting the steering wheel audio control switches, deactivate the air bags. Refer to Section 501-20B . • Key in OFF position. • Disconnect: Steering Wheel Audio Control Switch Connector. • Measure the resistance between the steering wheel audio control switch connector pin 3 circuit 31S-PG24 (BK/OG), harness side and ground (CDX6); or between the steering wheel audio control switch connector pin 3 circuit 31S-PG24 (BK/OG), harness side and the audio unit C290b-19 (DM100i) circuit 31S-MD26 (BK/RD), harness side; or between the steering wheel audio control switch connector pin 3 circuit 31S-PG24 (BK/OG), harness side and the audio unit C2253a-19 (VNR), circuit 31S-MD26 (BK/RD), harness side. • **Is the resistance less than 5 ohms?**	**Yes** INSTALL new steering wheel audio control switches. REFER to Steering Wheel Audio Controls in this section. TEST the system for normal operation. **No** GO to H5 .
H5 CHECK CIRCUIT 31S-PG24 (BK/OG) BETWEEN THE CLOCKSPRING AND THE GROUND	
• Key in OFF position. • Disconnect: C218b. • Measure the resistance between clockspring C218b-3, circuit 31S-PG24 (BK/OG), harness side and ground (CDX6); or between clockspring C218b-3, circuit 31S-PG24 (BK/OG), harness side and the audio unit C290b-19 (DM100i), circuit 31S-MD26 (BK/RD), harness side; or between clockspring C218b-3, circuit 31S-PG24 (BK/OG), harness side and the audio unit C2253a-19 (VNR), circuit 31S-MD26 (BK/RD), harness side. • **Is the resistance less than 5 ohms?**	**Yes** INSTALL new steering wheel audio control switches. REFER to Steering Wheel Audio Controls in this section. TEST the system for normal operation. **No** For DM100i or VNR audio units, REPAIR circuit 31S-PG24 (BK/OG). For CDX6, GO to H6 .
H6 CHECK CIRCUIT 31S-PG24 (BK/OG) BETWEEN THE CLOCKSPRING AND THE POWERTRAIN CONTROL MODULE (PCM)	
• Key in OFF position. • Disconnect: Powertrain Control module (PCM) 175a. • Measure the resistance between clockspring C218b-3 circuit 31S-PG24 (BK/OG), harness side and PCM C175a-56 circuit 31S-PG24 (BK/OG),	**Yes** GO to H7 . **No** REPAIR circuit

harness side.  • **Is the resistance less than 5 ohms?**	31S-PG24 (BK/OG). TEST the system for normal operation.
H7 CHECK FOR PCM OPERATION	

• Check for:
  • corrosion
  • pushed out pins
• Connect the PCM, and make sure it seats correctly.
• Clear the DTCs and repeat the self-test.
• **Is the DTC still present?**
	Yes
	INSTALL a new brake system control module. REFER to Section 303-14. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by loose or corroded connector.

Pinpoint Test I: Loud Popping Sound When Cycling The Key CDX6 and Vehicle Navigation Radio (VNR) Only

Normal Operation

The START input circuit 50-MD15 (GY/OG) is sent to the audio unit when the key is turned to the START position. The audio unit then immediately mutes all speaker amplifier outputs and the subwoofer amplifier enable circuit output to eliminate the possibility of speaker pops during engine cranking.

Possible Causes

- audio unit
- circuit 7-MD19 (YE/RD) open, short to power, short to ground

PINPOINT TEST I: LOUD POPPING SOUND WHEN CYCLING THE KEY CDX6 AND VNR ONLY

Test Step	Result / Action to Take
I1 CHECK CIRCUIT 7-MD19 (YE/RD) FOR POWER	
• Key in OFF position. • Disconnect: Subwoofer Amplifier C466a. • Key in ON position. • **NOTE:** There should be voltage present when the key is in the ACC and ON positions, but not when the key is in the OFF position. • Measure the voltage between the subwoofer amplifier C466a-1, circuit 7-MD19 (YE/RD) harness side and	**Yes** GO to I2 . **No** GO to I3 .

ground, while cycling the key from OFF to ACC to ON to ACC to OFF. Pause in the ACC and ON positions to allow for the audio unit to power up and initialize.  A0057140 • **Is the voltage present as expected?**	
I2 SUBSTITUTE A SUBWOOFER AMPLIFIER	
• Key in OFF position. • Substitute a known good subwoofer amplifier. • Cycle the key from OFF to ACC to ON to ACC to OFF. • **Is the popping eliminated?**	**Yes** INSTALL a new subwoofer amplifier. REFER to Subwoofer Amplifier in this section. TEST the system for normal operation. **No** GO to I3 .
I3 CHECK CIRCUIT 7-MD19 (YE-RD) FOR POWER WITHOUT AUDIO UNIT ON AND IGNITION OFF	
• Key in OFF position. • Disconnect: Audio Unit C240b (CDX6). • Disconnect: Audio Unit C2253d (VNR). • Measure the voltage between the subwoofer amplifier C466a-1, circuit 7-MD19 (YE/RD), harness side and ground.  A0057140 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to I4 .
I4 CHECK THE ENABLE CIRCUIT TO THE SUBWOOFER AMPLIFIER	
• For CDX6, measure the resistance between the subwoofer amplifier C466a-1, circuit 7-MD19 (YE/RD), harness side and the audio unit C240b-4, circuit 7-MD19 (YE/RD), harness side: and between the subwoofer amplifier C466a-1, circuit 7-MD19 (YE/RD) harness side and ground.	**Yes** GO to I5 . **No** REPAIR the circuit. TEST the system for normal operation.

 A0057141 • For VNR, measure the resistance between the subwoofer amplifier C466a-1, circuit 7-MD27 (YE/RD), harness side and the audio unit C2253d-9, circuit 10-MD27 (GY/WH), harness side: and between the subwoofer amplifier C466a-1, circuit 7-MD19 (YE/RD) harness side and ground.  A0057142 • **Is the resistance less than 5 ohms between the subwoofer amplifier and the audio unit, and greater than 10,000 ohms between the subwoofer amplifier and ground?**	
I5 CHECK VOLTAGE ON ENABLE CIRCUIT WITH IGNITION ON	
• Key in ON position. • Measure the voltage between the subwoofer amplifier C466a-1, circuit 7-MD19 (YE/RD), harness side and ground.  A0057140 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** REMOVE the audio unit and SEND it to an authorized audio system repair facility. REFER to Audio Unit in this section. TEST the system for normal operation.

Antenna Grid Wire Repair

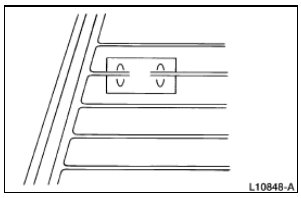
Printable View (19 KB)

Special Tool(s)

ST1171-A	Heat Gun or equivalent 107-R0300

NOTE: Any breaks longer than 25.4 mm (1 in) in one grid cannot be repaired. The back window glass must be replaced. Breaks equal to or shorter than 25.4 mm (1 in) in the antenna grid wire can be successfully repaired by using the following procedure:

1. The vehicle should be brought inside and allowed to reach 16°C (60°F) or above.
2. Clean the repair area with denatured alcohol.
3. Place the grid line mask over the break aligning the cut out slots on either side of the repair area.



4. Apply the epoxy from the grid wire repair kit to the repair area.
5. Remove the mask without disturbing the epoxy.
6. Use heat gun to heat the repair area for one to two minutes at a distance of about 25-50 mm (1-2 in). This procedure should heat the repair area to approximately 149°C (300°F).
7. Optimum hardness and adhesion will occur after 24 hours. Do not disturb the repaired area until that time.

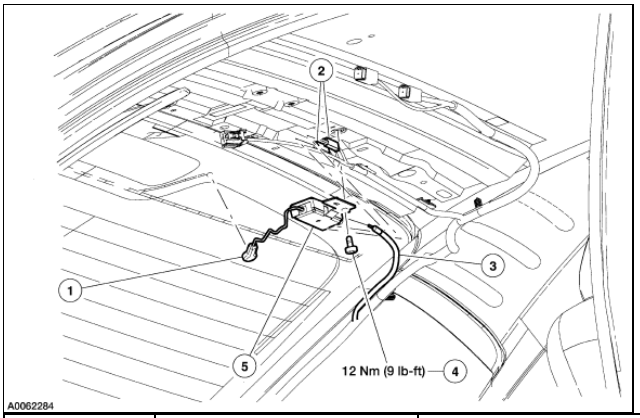
Antenna

Printable View (111 KB)

NOTE: The antenna is a conductive trace integral to the rear window glass and can be repaired, but not installed separately. For removal and installation of the back glass, refer to Section 501-00. For repair procedures, refer to Antenna Grid Wire Repair in this section.

NOTE: Antenna cable is not serviceable, it comes with the interior harness.

1. Disconnect the battery ground cable. For additional information, refer to Section 414-00 .
2. Remove the LH and RH rear quarter panel trim panels. For additional information, refer to Section 501-01 .
3. Lower the rear of the headliner.
4. Remove the components in the order indicated in the following illustration and table.

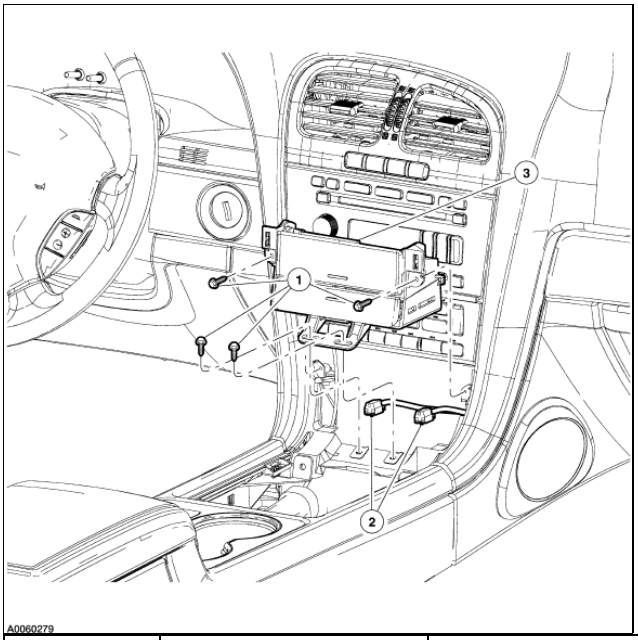


Item	Part Number	Description
1		Connector (part of 18C847)
2	14489	Electrical connectors
3	14489	Antenna cable
4		Bolt (part of 18C847)
5	18C847	Antenna isolator module

5. To install, reverse the removal procedure.

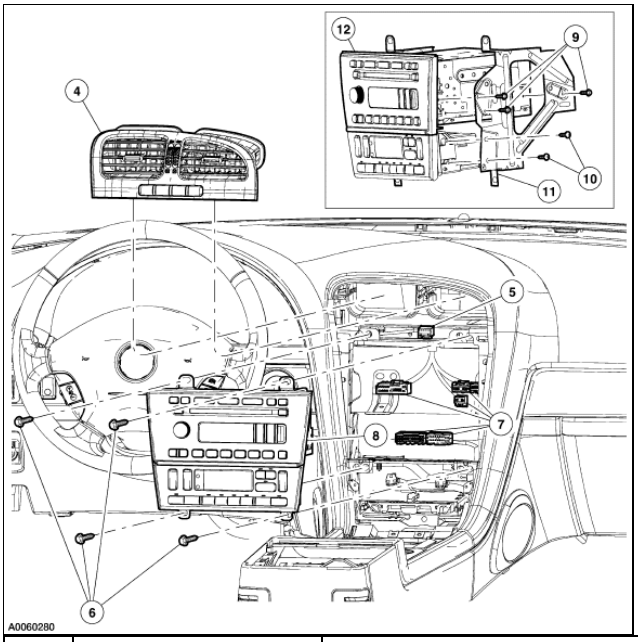
Audio Unit Printable View (338 KB)

1. Disconnect the battery ground cable. For additional information, refer to Section 414-00 .
2. Remove the console finish panel. For additional information, refer to Section 501-01 .
3. View 1 of 2. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1		Screws (4 required)
2	14401	Electrical connectors
3	4048A28	Console ash tray assembly

4. View 2 of 2. Remove the components in the order indicated in the following illustration and table.



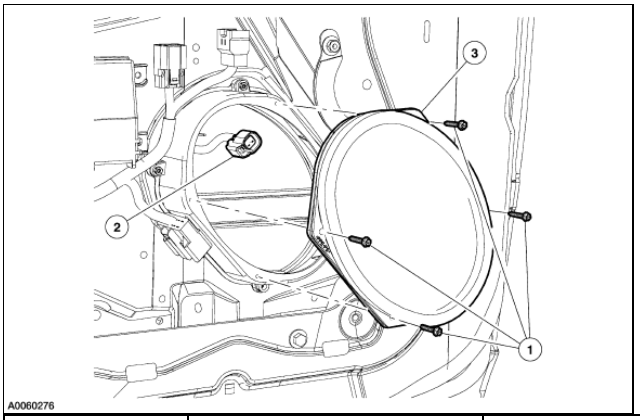
Item	Part Number	Description
4	19C894	Center register panel
5	14401	Electrical connector
6		Screws (4 required)
7	14401	Electrical connectors
8	150102, 120403	Audio unit/dual automatic temperature control (DATC) assembly.
9		Audio unit screws (6 required)
10		Climate control screws (4 required)
11	404452 (RH), 404453 (LH)	Brackets
12	150102	Audio unit

5. To install, reverse the removal procedure.

Door Speaker Printable View (98 KB)

NOTE: The removal and installation procedures apply to all original equipment door-mounted speakers.

1. Remove the door trim panel. For additional information, refer to Section 501-01 .
2. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1	W701930-S	Screws (4 required)
2	14A005	Speaker connector
3	18808	Speaker

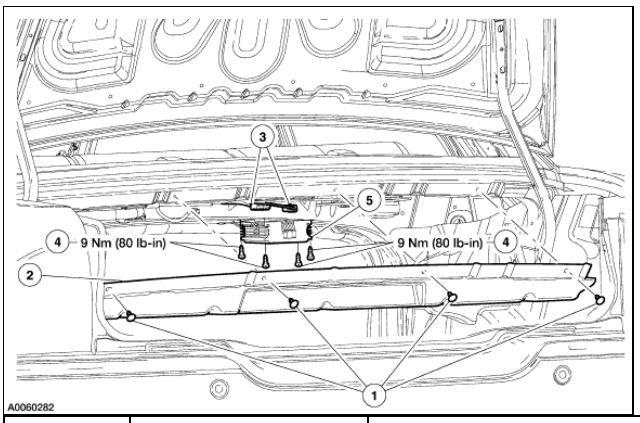
3. To install, reverse the removal procedure.

Subwoofer Amplifier

Printable View (116 KB)

1. Disconnect the battery ground cable. For additional information, refer to Section 414-00 .

2. Remove the components in the order indicated in the following illustration and table.



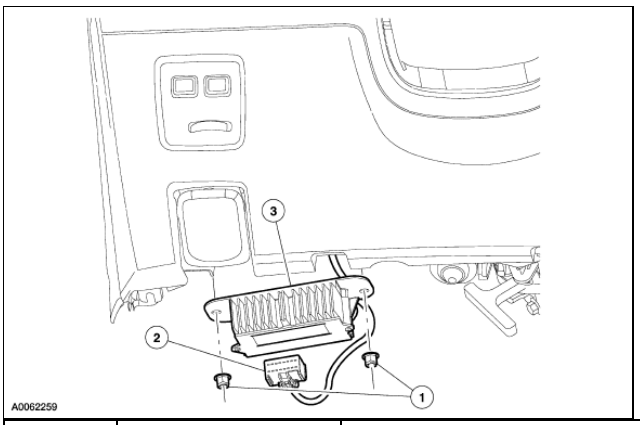
Item	Part Number	Description
1	811405	Pin-type retainers (4 required)
2	445443	Luggage compartment front cover
3	14A005	Electrical connectors
4		Screws (4 required)
5	150103	Subwoofer amplifier and bracket

3. To install, reverse the removal procedure.

Audio Unit Amplifier Center Imaging

Printable View (58 KB)

1. Remove the driver side kick panel.
2. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1	520201	Nuts (2 required)
2	14489	Electrical connector
3	18T805A	Center imaging amplifier and bracket

Item	Part Number	Description
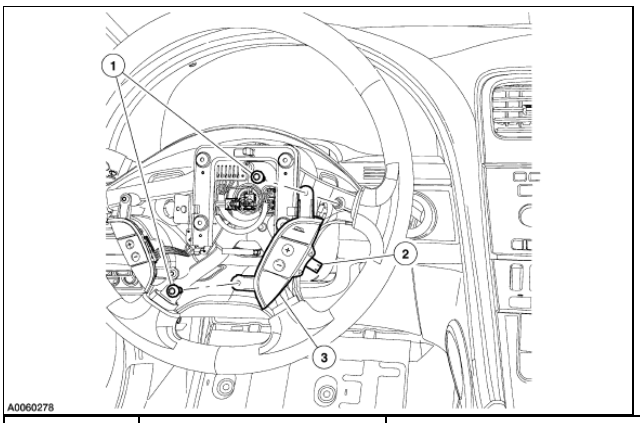
1	701930	Screws (4 required)
2	14A005	Electrical connector
3	18808	Speaker

3. To install, reverse the removal procedure.

Steering Wheel Audio Controls

Printable View (108 KB)

1. Remove the driver air bag module. For additional information, refer to Section 501-20B .
2. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1	15835-035	Screws (2 required)
2	13A876	Electrical connector
3	14K147-A	Steering wheel control switches

3. To install, reverse the removal procedure.

Exterior Lighting Printable View (15 KB)

NOTE: The front electronic module (FEM), the rear electronic module (REM) and the instrument cluster must be reconfigured before installing a new module. Refer to Section 418-00 .

The vehicle electronic functions are divided into zones. The FEM controls the front portion of the vehicle and the REM controls the rear portion of the vehicle. These systems rely on the standard corporate protocol (SCP) communication network in order to transmit and receive signals. It is very important to understand:

- where the input (command) originates from.
- all information (messages) necessary in order for a feature to operate.
- which module(s) receive(s) the input or command message.
- if the module which received the input (message) controls the output of the feature, or does it output a message over the SCP communication network to another module.
- which module controls the output of the feature.

Exterior Lighting

The exterior lighting outputs are zone controlled by the FEM and REM. The front exterior lights are controlled by the FEM and the rear exterior lights are controlled by the REM. An additional function of the lighting system is a lamp outage function which indicates to the driver if certain exterior bulbs are not functioning. With a bulb inoperative, the FEM or REM will send a message to the instrument cluster and message center (if equipped with the message center), which will indicate to the driver that the lamp is inoperative with a lamp out indicator (with the message center a message will be displayed). All exterior lighting is powered by the switched system power (SSP) feature (for additional information, refer to Switched System Power [SSP]). A failure of all or any of the SSP features will cause inoperative exterior lighting. When diagnosing exterior lighting, it is essential to determine if all related symptoms and DTCs are controlled by the SSP feature.

Switched System Power (SSP)

The SSP is utilized by both the FEM and REM. This function removes power from relays that provide power to the exterior lamps, interior lamps, and power door locks. This is only accomplished when both the FEM and the REM are in sleep mode. The sleep function of the FEM and REM places the modules in sleep mode when the ignition switch is in the OFF position, and no wake up (input) signals occur for 30 minutes. The module will not sleep if the parking lamps or the hazard lamps are active. The following relays are controlled by the SSP function: SSP1, SSP2, SSP3, and SSP4. When either the FEM or REM are not in sleep mode, all SSP relays will be energized. When energized, each relay will supply power to multiple features/functions. For additional information, refer to the SSP Index for diagnosis and testing of SSP related issues.

Headlamps

The headlamps are controlled by the FEM and the instrument cluster. The headlamp and multifunction switches are hard-wired to the instrument cluster. When the headlamp switch is in any position, the instrument cluster will send a command to the FEM through the SCP communication network. The FEM will process this information and output the appropriate command to the headlamps, which are hard-wired to the FEM (if equipped with high intensity discharge (HID) headlamps, the HID relays are hard-wired to and controlled by the FEM). This is the same for the low and high beams and flash-to-pass position. Either low or high beam will provide a lamp outage indication (halogen bulbs only). Fault management of the headlamps will provide some headlamp functionality. In the event of all multifunction switch, all headlamp switch or ignition switch invalid or missing data failures, the low beams will be illuminated. There is also a headlamp battery saver feature. This feature turns off the headlamps ten minutes after the ignition switch is turned OFF when the

headlamp switch is in the headlamps ON position. The battery saver does not function if the headlamp switch is in the parking lamps ON position.

NOTE: Daytime running lamps (DRL) feature is available for Canadian vehicles only.

Autolamps and DRL are two functions which the FEM may be configured to include.

Autolamps

The autolamps are controlled by the headlamp switch, photocell sensor, instrument cluster and the FEM. The headlamps may be in the high or low beam position depending on the multifunction switch position. When the headlamp switch is in the autolamp position, the instrument cluster sends an ON or OFF command to the FEM, depending on the signal from the autolamp sensor. The FEM processes this information and outputs the appropriate command to the headlamps. The headlamps are hard-wired to the FEM. The autolamps remain ON for approximately 20 seconds to three minutes (depending on customer preferences) after the ignition switch is changed from the ON position to the ACC or OFF position.

Turn Signal, Cornering and Hazard Lamps

The LH and RH front turn signal, LH and RH rear turn signal outputs, front and rear hazard lamp outputs are controlled by the FEM and REM. The multifunction switch and the hazard switch are hard-wired to the instrument cluster. When the switch is in the left or right turn position, or the hazard switch is in the ON position, the instrument cluster sends a command through the standard corporate protocol (SCP) network to the FEM and REM, which processes this information and outputs the appropriate command to the front and rear turn signal and hazard lamps. All turn signal lamps will provide lamp outage indication.

Parking, Rear or License Lamps

For the LH and RH rear parking, license, and LH and RH front parking lamps, outputs are controlled by the FEM and REM. The headlamp switch is hard-wired to the instrument cluster. When the headlamp switch is in the headlamps ON or parking lamps ON position, the instrument cluster sends a command via the network link to the FEM and REM. The FEM and REM process this information and output the appropriate command to the parking or license lamps, which are hard-wired to the FEM and REM. Only the left and right rear lamps will provide lamp outage indication. Fault management of the parking lamps provides rear parking lamp functionality in the event of certain multifunction switch, headlamp switch, ignition switch, FEM or REM failures.

Fog Lamps

The fog lamps are controlled by the headlamp switch. The switch toggles the fog lamps between on and off. When activated, the switch sends voltage to the instrument cluster. The instrument cluster sends a signal to the FEM which activates the fog lamp.

Reversing Lamps

The reversing lamps are controlled by the REM and powertrain control module (PCM). The PCM sends a message through the SCP communication network to the REM indicating the transmission is in REVERSE. The REM processes this information and outputs the command to the reversing lamps which are hard-wired to the REM. Fault management of the reversing lamps will provide limited reversing lamp functionality. In the event of missing or invalid transmission data, the reversing lamps remain in the last state of operation prior to the failure for one key cycle. In the event of invalid or missing data for the ignition switch, the lamps will work in relation to PRNDL messages.

NOTE: DRL feature is available for Canadian vehicles only.

Daytime Running Lamps (DRL)

If the FEM is configured for daytime running lamps (DRL), this feature illuminates the high beam headlamps, pulse width modulated at a 40% duty cycle when the following conditions exist:

- the ignition switch is in the ON position.
- the headlamp switch is in the OFF or PARK position.
- the autolamps feature has not illuminated the exterior lamps.

Headlamps Printable View (327 KB)

Refer to Wiring Diagrams Cell 87 for schematic and connector information.

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052 or equivalent diagnostic tool with appropriate adapter cable

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

   Visual Inspection Chart

Mechanical	Electrical
• Headlamp switch	• Auxiliary junction box (AJB) fuses: ♦ 7 (15A) (RH high intensity discharge [HID] relay if equipped) ♦ 8 (15A) (LH HID relay if equipped) • Central junction box (CJB) fuses: ♦ 9 (10A) (RH low beam) ♦ 11 (10A) (LH high beam) ♦ 20 (10A) (FEM and instrument cluster) ♦ 23 (10A) (RH high beam) ♦ 25 (10A) (LH low beam) • Battery junction box (BJB) fuses: ♦ 23 (30A) (SSP4) ♦ 24 (30A) (SSP3) ♦ 27 (30A) (SSP1) ♦ 32 (30A) (SSP2) • Circuitry • Front electronic module (FEM) • Instrument cluster • Halogen bulbs

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

4. If the cause is not visually evident, connect the diagnostic tool to the data link connector and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
   - check that the program card is correctly installed.
   - check the connections to the vehicle.
   - check the ignition switch position.

5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

6. Carry out the diagnostic tool data link test. If the diagnostic tool responds with:
   - SCP+, SCP-, ISO or UBP circuit fault; all electronic control units no response/not equipped, refer to Section 418-00 .
   - No response/not equipped for FEM, refer to Section 418-00 .
   - No response/not equipped for instrument cluster, refer to Section 413-00 .
   - System passed, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out self-test diagnostics for the FEM.

7. If the DTCs retrieved are related to the concern, go to the Front Electronic Module (FEM) Diagnostic Trouble Code (DTC) Index or Instrument Cluster Diagnostic Trouble Code (DTC) Index to continue diagnostics.

8. If multiple symptoms exist, check the Switched System Power (SSP) Relay Index before proceeding to the next step. Refer to Headlamps in this section.

9. If no DTCs related to the concern are retrieved, GO to Symptom Chart to continue diagnostics.

NOTE: For a complete master list of DTCs, refer to Section 418-00 .

Front Electronic Module (FEM) Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1342	ECU Is Defective	FEM	CLEAR the DTCs. RETRIEVE the DTCs. If DTC B1342 is retrieved, INSTALL a new FEM. REFER to Section 418-00 .
B1567	Lamp Headlamp High-Beam Circuit Failure	FEM	If high beam is inoperative, Go To Pinpoint Test D . If high beam is always on, Go To Pinpoint Test E .
B1794	Lamp Headlamp Low-Beam Circuit Failure	FEM	If low beam is inoperative, Go To Pinpoint Test C . If low beam is always on, Go To Pinpoint Test E .

Instrument Cluster Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1342	ECU Is Defective	Instrument cluster	CLEAR and DOCUMENT the DTCs. CARRY OUT the instrument cluster Self-Test. INSTALL a new instrument cluster if DTC B1342 is retrieved again. REFER to Section 413-00 .
B1470			Go To Pinpoint Test E .

	Lamp Headlamp Input Circuit Failure	Instrument cluster	
B1567	Lamp Headlamp High-Beam Circuit Failure	Instrument cluster	Go To Pinpoint Test B .

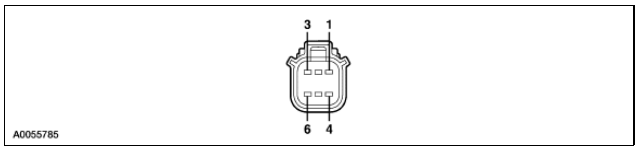
Symptom Chart

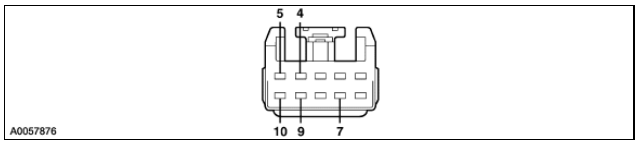
Symptom Chart
Connector Circuit Reference

LH Headlamp C1021, RH Headlamp C1041



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1 (C1021) (standard headlamp)	29S-LE16 (OG/GN) low beam headlamp power supply circuit	Greater than 10 volts with the key ON.
1 (C1021) (HID headlamp)	30S-LE16 (RD/BK) low beam headlamp power supply circuit	0 voltage, less than 5 ohms between the headlamp and the LH HID relay. Greater than 10 volts with the low beam headlamps ON.
3 (C1021)	29S-LE15 (OG/BK) high beam headlamp power supply circuit	Greater than 10 volts with the key ON.
4 (C1021) (standard headlamp)	31S-LE16 (BK/RD) low beam headlamp control ground circuit	0 voltage, less than 5 ohms between the headlamp and the FEM.
4 (C1021) (HID headlamp)	31-LE16 (BK/RD) low beam headlamp ground circuit	0 voltage, less than 5 ohms between the headlamp ground.
6 (C1021)	31S-LE15 (BK/GN) high beam headlamp control ground circuit	0 voltage, less than 5 ohms between the headlamp and the FEM.
1 (C1041) (standard headlamp)	29S-LE23 (OG/WH) low beam headlamp power supply circuit	Greater than 10 volts with the key ON.
1 (C1041) (HID headlamp)	30S-LE23 (RD/WH) low beam headlamp power supply circuit	0 voltage, less than 5 ohms between the headlamp and the LH HID relay. Greater than 10 volts with the low beam headlamps ON.
3 (C1041)	29S-LE22 (OG/GN) high beam headlamp power supply circuit	Greater than 10 volts with the key ON.
4 (C1041) (standard headlamp)	31S-LE23 (BK/WH) low beam headlamp control ground circuit	0 voltage, less than 5 ohms between the headlamp and the FEM.
4 (C1041) (HID headlamp)	31-LE23 (BK/WH) low beam headlamp ground circuit	0 voltage, less than 5 ohms between the headlamp ground.
6 (C1041)	31S-LE22 (BK/RD) high beam headlamp control ground circuit	0 voltage, less than 5 ohms between the headlamp and the FEM.

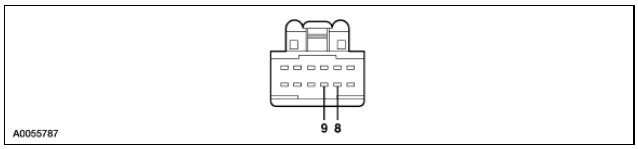
Headlamp Switch C205



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement

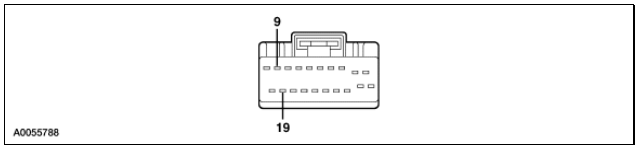
4	10-LE47 (GY/OG) instrument cluster autolamps ON signal	Approximately 5 volts when the SSP relays are energized, less than 5 ohms between headlamp switch and the instrument cluster. Greater than 10,000 ohms between the headlamp switch and ground.
5	8-LF14 (WH/BU) instrument cluster parking lamps ON signal	Approximately 5 volts when the SSP relays are energized, less than 5 ohms between headlamp switch and the instrument cluster. Greater than 10,000 ohms between the headlamp switch and ground.
7	9-LE29 (BN/GN) headlamp switch return signal	0 voltage less than 5 ohms between the headlamp switch and instrument cluster. Greater than 10,000 ohms between the headlamp switch and ground.
9	10-LE21 (GY/OG) instrument cluster headlamps OFF signal	Approximately 5 volts when the SSP relays are energized, less than 5 ohms between headlamp switch and the instrument cluster. Greater than 10,000 ohms between the headlamp switch and ground.
10	8-LE21 (WH/GN) instrument cluster headlamps ON signal	Approximately 5 volts when the SSP relays are energized, less than 5 ohms between headlamp switch and the instrument cluster. Greater than 10,000 ohms between the headlamp switch and ground.

Multifunction Switch C202



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
8	9-LG43 (BN/WH) multifunction switch return signal	0 voltage, less than 5 ohms between the multifunction switch and the instrument cluster. Greater than 10,000 ohms between the multifunction switch and ground.
9	8-LE14 (WH/BU) instrument cluster high beam request signal	Approximately 5 volts when the SSP relays are energized, less than 5 ohms between multifunction switch and the instrument cluster. Greater than 10,000 ohms between the multifunction switch and ground.

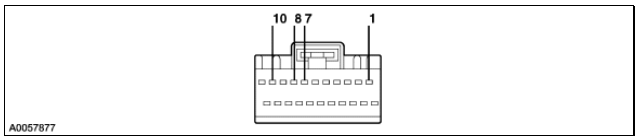
Instrument Cluster C220b



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
9	9-LG43 (BN/WH) multifunction switch return signal	0 voltage, less than 5 ohms between the instrument cluster and the multifunction switch. Greater than 10,000 ohms

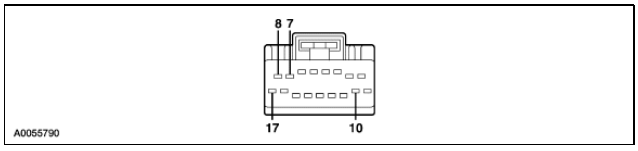
		between the instrument cluster and ground.
19	8-LE14 (WH/BU) instrument cluster high beam request signal	0 voltage, less than 5 ohms between the instrument cluster and the multifunction switch. Greater than 10,000 ohms between the instrument cluster and ground.

Instrument Cluster C220c



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	9-LE29 (BN/GN) headlamp switch return signal	0 voltage, less than 5 ohms between the instrument cluster and the headlamp switch. Greater than 10,000 ohms between the instrument cluster and ground.
7	10-LE21 (GY/OG) instrument cluster headlamps OFF signal	0 voltage, less than 5 ohms between the instrument cluster and the headlamp switch. Greater than 10,000 ohms between the instrument cluster and ground.
8	8-LF14 (WH/BU) instrument cluster parking lamps ON signal	0 voltage, less than 5 ohms between the instrument cluster and the headlamp switch. Greater than 10,000 ohms between the instrument cluster and ground.
10	8-LE21 (WH/GN) instrument cluster headlamps ON signal	0 voltage, less than 5 ohms between the instrument cluster and the headlamp switch. Greater than 10,000 ohms between the instrument cluster and ground.

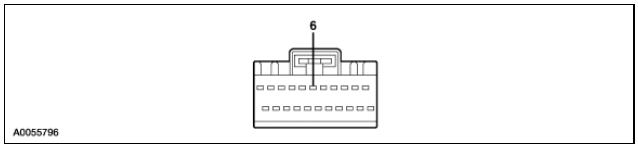
FEM C201a



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
7	31S-LE23 (BK/WH) RH halogen low beam control ground circuit	Greater than 10 volts with the key ON. Less than 5 ohms between the FEM and headlamp. Greater than 10,000 ohms between the FEM and ground.
8	31S-LE16 (BK/RD) LH halogen low beam control ground circuit	Greater than 10 volts with the key ON. Less than 5 ohms between the FEM and headlamp. Greater than 10,000 ohms between the FEM and ground.
10	31S-LE22 (BK/RD) RH halogen high beam control ground circuit	Greater than 10 volts with the key ON. Less than 5 ohms between the FEM and headlamp. Greater than 10,000 ohms between the FEM and ground.

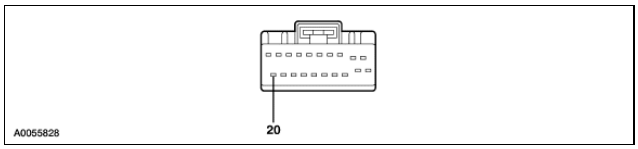
17	31S-LE15 (BK/GN) LH halogen high beam control ground circuit	Greater than 10 volts with the key ON. Less than 5 ohms between the FEM and headlamp. Greater than 10,000 ohms between the FEM and ground.

FEM C201b



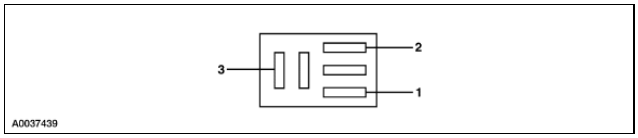
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
6	91S-LE16 (BN/YE) LH HID low beam control ground circuit	Greater than 10 volts with the key ON. Less than 5 ohms between the FEM and LH HID relay. Greater than 10,000 ohms between the FEM and ground.

FEM C201f



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
20	91S-LE23 (BN/WH) RH HID low beam control ground circuit	Greater than 10 volts with the key ON. Less than 5 ohms between the FEM and RH HID relay. Greater than 10,000 ohms between the FEM and ground.

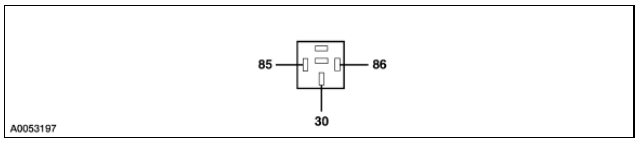
LH HID Relay C1379, RH HID Relay C1380



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1 (C1379)	29S-LE16 (OG/GN) voltage supply circuit	Greater than 10 volts with the key ON.
2 (C1379)	91S-LE16 (BN/YE) control ground circuit	0 voltage, less than 5 ohms between the HID relay and the FEM.
3 (C1379)	30-LE31 (RD/YE) B+ power supply circuit	Greater than 10 volts with the ignition in any position.
1 (C1380)	29S-LE23 (OG/WH) voltage supply circuit	Greater than 10 volts with the key ON.

2 (C1380)	91S-LE23 (BN/WH) control ground circuit	0 voltage, less than 5 ohms between the HID relay and the FEM.
3 (C1380)	30-LE30 (RD/BU) B+ power supply circuit	Greater than 10 volts with the ignition in any position.

SSP1 Relay, SSP2 Relay, SSP3 Relay, SSP4 Relay



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
30 (C441)	30-DG52 (RD/BU) B+ power supply circuit	Greater than 10 volts with the ignition in any position.
85 (C441)	31S-DG51 (BK/YE) relay coil control ground	0 voltage, less than 5 ohms between the relay and the FEM or REM. Less than 5 ohms between the relay and other SSP relays.
86 (C441)	30-DG51 (RD/YE) B+ power supply circuit	Greater than 10 volts with the ignition in any position.
30 (C442)	30-DG54 (RD/GN) B+ power supply circuit	Greater than 10 volts with the ignition in any position.
85 (C442)	31S-DG53 (BK/OG) relay coil control ground	0 voltage, less than 5 ohms between the relay and the FEM or REM. Less than 5 ohms between the relay and other SSP relays.
86 (C442)	30-DG53 (RD/OG) B+ power supply circuit	Greater than 10 volts with the ignition in any position.
30 (C444)	30-DG56 (RD/WH) B+ power supply circuit	Greater than 10 volts with the ignition in any position.
85 (C444)	31S-DG55 (BK/RD) relay coil control ground	0 voltage, less than 5 ohms between the relay and the FEM or REM. Less than 5 ohms between the relay and other SSP relays.
86 (C444)	30-DG55 (RD/BK) B+ power supply circuit	Greater than 10 volts with the ignition in any position.
30 (C445)	30-DG58 (RD/BU) B+ power supply circuit	Greater than 10 volts with the ignition in any position.
85 (C445)	31S-DG57 (BK/YE) relay coil control ground	0 voltage, less than 5 ohms between the relay and the FEM or REM. Less than 5 ohms between the relay and other SSP relays.
86 (C445)	30-DG57 (RD/YE) B+ power supply circuit	Greater than 10 volts with the ignition in any position.

Pinpoint Test A: Both Headlamps Are Inoperative

Normal Operation

The instrument cluster monitors the headlamp switch position by sending out voltage reference signals to the headlamp switch. If a problem is detected with the low beam signal circuit (8-LE21 [GY/OG]), the headlamps off signal circuit (10-LE21 [GY/OG]) or the signal return circuit (9-LE29 [BN/GN]) from the headlamp switch, the instrument cluster will default the headlamps and parking lamps ON. When the headlamp switch is in the headlamps ON position, the instrument cluster sends a signal to the front electronic module (FEM) to illuminate the headlamps.

Possible Causes

- headlamp switch
- FEM.
- instrument cluster

PINPOINT TEST A: BOTH HEADLAMPS ARE INOPERATIVE

Test Step	Result / Action to Take
A1 CHECK THE HEADLAMP SWITCH OUTPUT	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Monitor the instrument cluster headlamp switch status PID while rotating the knob to the headlamps ON position. • **Does the PID match with the headlamp switch position?**	**Yes** GO to A4 . **No** GO to A2 .
A2 CHECK THE HEADLAMP SWITCH	
• Key in OFF position. • Disconnect: Headlamp Switch C205. • Carry out the headlamp switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the headlamp switch OK?**	**Yes** GO to A3 . **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. TEST the system for normal operation.
A3 CHECK FOR INSTRUMENT CLUSTER OPERATION	

• Key in OFF position.
• Disconnect all instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

A4 CHECK FOR FEM OPERATION	

• Key in OFF position.
• Disconnect all FEM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all FEM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FEM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test B: The High Beams Are Inoperative

Normal Operation

The instrument cluster monitors the multifunction switch positions. The instrument cluster sends out a voltage reference signal to the multifunction switch through circuit 8-LE14 (WH/BU). The return signal is sent through circuit 9-LG43 (BN/WH). When the multifunction switch is in the high beam position, the instrument cluster sends a signal to the front electronic module (FEM) to illuminate the high beams. If a problem is detected with the circuits to the multifunction switch, the instrument cluster will not send a signal to the FEM to illuminate the high beams.

Possible Causes

- circuit 8-LE14 (WH/BU) open, shorted to ground or shorted to power
- circuit 9-LG43 (BN/WH) open, shorted to ground or shorted to power
- multifunction switch
- FEM
- instrument cluster

PINPOINT TEST B: THE HIGH BEAMS ARE INOPERATIVE

Test Step	Result / Action to Take
B1 MONITOR THE INSTRUMENT CLUSTER HIGH BEAM INPUT STATUS PID	
• Key in ON position. • Connect the diagnostic tool. • Monitor the instrument cluster high beam input status PID while moving the multifunction switch from the low beam position to the high beam positions. • **Does the PID agree with the positions of the multifunction switch?**	**Yes** GO to B8 . **No** GO to B2 .
B2 CHECK THE MULTIFUNCTION SWITCH	
• Key in OFF position. • Disconnect: Multifunction Switch C202. • Carry out the multifunction switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the multifunction switch OK?**	**Yes** GO to B3 . **No** INSTALL a new multifunction switch. REFER to Section 211-00 . TEST the system for normal operation.

B3 CHECK CIRCUIT 8-LE14 (WH/BU) FOR SHORT TO POWER	
• Disconnect: Instrument Cluster C220b. • Key in ON position. • Measure the voltage between the instrument cluster C220b-19, circuit 8-LE14 (WH/BU), harness side and ground.  • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation. **No** GO to B4 .
B4 CHECK CIRCUIT 8-LE14 (WH/BU) FOR AN OPEN OR SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between the instrument cluster C220b-19, circuit 8-LE14 (WH/BU), harness side and ground; and between the instrument cluster C220b-19, circuit 8-LE14 (WH/BU), harness side and the multifunction switch C202-9, circuit 8-LE14 (WH/BU), harness side.  • **Is the resistance greater than 10,000 ohms between the instrument cluster and ground; and less than 5 ohms between the instrument cluster and the multifunction switch?**	**Yes** GO to B5 . **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.
B5 CHECK CIRCUIT 9-LG43 (BN/WH) FOR SHORT TO POWER	
• Key in ON position. • Measure the voltage between the instrument cluster C220b-9, circuit 9-LG43 (BN/WH), harness side and ground.  • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation. **No** GO to B6 .
B6 CHECK CIRCUIT 9-LG43 (BN/WH) FOR AN OPEN OR SHORT TO GROUND	

• Key in OFF position. • Measure the resistance between the instrument cluster C220b-9, circuit 9-LG43 (BN/WH), harness side and ground; and between the instrument cluster C220b-9, circuit 9-LG43 (BN/WH), harness side and the multifunction switch C202-8, circuit 9-LG43 (BN/WH), harness side.  • **Is the resistance greater than 10,000 ohms between the instrument cluster and ground; and less than 5 ohms between the instrument cluster and multifunction switch?**	**Yes** GO to B7 . **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.
B7 CHECK FOR INSTRUMENT CLUSTER OPERATION	

• Key in OFF position.
• Disconnect all instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

B8 CHECK FOR FEM OPERATION	

• Key in OFF position.
• Disconnect all FEM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all FEM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FEM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: One Low Beam Headlamp Is Inoperative

Normal Operation Standard Headlamps

The LH low beam receives power through circuit 29S-LE16 (OG/GN). Ground for the LH low beam is provided through circuit 31S-LE16 (BK/RD). The RH low beam receives power through circuit 29S-LE23 (OG/WH). Ground for the RH low beam is provided through circuit 31S-LE23 (BK/WH). The front electronic module (FEM) controls the ground for both low beam headlamps.

Normal Operation High Intensity Discharge (HID) Headlamps

The LH HID relay coil receives power through circuit 29S-LE16 (OG/GN). Ground for the LH HID relay coil is provided through circuit 91S-LE16 (BN/YE) and is controlled by the FEM. Battery voltage is supplied to the LH HID relay through circuit 30-LE31 (RD/YE). When the relay is energized, voltage is switched to the LH ballast through circuit 30S-LE16 (OG/GN). Circuit 31-LE16 (BK/RD) supplies ground to the LH ballast. The RH HID relay coil receives power through circuit 29S-LE23 (OG/WH). Ground for the RH HID relay coil is provided through circuit 91S-LE23 (BN/WH) and is controlled by the FEM. Battery voltage is supplied to the RH HID relay through circuit 30-LE30 (RD/BU). When the relay is energized, voltage is switched to the RH ballast through circuit 30S-LE23 (OG/WH). Circuit 31-LE23 (BK/WH) supplies ground to the RH ballast. The FEM controls the ground for both HID relay coils. The ballasts provide the necessary voltage to power the HID bulbs. The ballast and HID bulb are replaced as an assembly.

Possible Causes

- circuit 29S-LE16 (OG/GN) (LH headlamp) open
- circuit 29S-LE23 (OG/WH) (RH headlamp) open
- circuit 31S-LE16 (BK/RD) (LH halogen headlamp) open or shorted to power
- circuit 31S-LE23 (BK/WH) (RH halogen headlamp) open or shorted to power
- circuit 91S-LE16 (BN/YE) (LH HID relay) open or shorted to power
- circuit 91S-LE23 (BN/WH) (RH HID relay) open or shorted to power
- circuit 30-LE31 (RD/YE) (LH HID relay) open
- circuit 30-LE30 (RD/BU) (RH HID relay) open
- circuit 30S-LE16 (OG/GN) (LH HID headlamp) open
- circuit 30S-LE23 (OG/WH) (RH HID headlamp) open
- circuit 31-LE16 (BK/RD) (LH HID headlamp) open
- circuit 31-LE23 (BK/WH) (RH HID headlamp) open
- HID relay
- ballast and HID bulb
- FEM

PINPOINT TEST C: ONE LOW BEAM HEADLAMP IS INOPERATIVE

Test Step	Result / Action to Take
C1 DETERMINE IF THE VEHICLE IS EQUIPPED WITH HID LIGHTING	
• Check the vehicle for HID headlamps. • **Is the vehicle equipped with HID headlamps?**	**Yes** GO to C7 . **No** GO to C2 .
C2 RETRIEVE THE FEM DIAGNOSTIC TROUBLE CODES (DTCs)	
NOTE: Make sure the headlamp switch is in the OFF position. • Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Carry out the FEM on-demand self-test. • **Are any DTCs present?**	**Yes** If DTC B1794, GO to C4 . All others, REFER to the FEM Diagnostic Trouble Code (DTC) index for correct diagnostics. **No**

	GO to C3 .
C3 CHECK CIRCUIT 31S-LE16 (BK/RD) (LH LOW BEAM) OR CIRCUIT 31S-LE23 (BK/WH) (RH LOW BEAM) FOR SHORT TO POWER	
• Key in OFF position. • Disconnect: FEM C201a. • Disconnect: LH Headlamp C1021 or RH Headlamp C1041. • Key in ON position. • Measure the voltage between the FEM C201a-8, circuit 31S-LE16 (BK/RD) (LH headlamp), harness side and ground; or between the FEM C201a-7, circuit 31S-LE23 (BK/WH) (RH headlamp), harness side and ground.  A0056735 • **Is any voltage present?**	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to C13 .
C4 CHECK CIRCUIT 29S-LE16 (OG/GN) (LH LOW BEAM) OR CIRCUIT 29S-LE23 (OG/WH) (RH LOW BEAM) FOR AN OPEN (HALOGEN HEADLAMP)	
• Key in OFF position. • Disconnect: LH Headlamp C1021 or RH Headlamp C1041. • Key in ON position. • Measure the voltage between the LH headlamp C1021-1, circuit 29S-LE16 (OG/GN), harness side and ground; or between the RH headlamp C1041-1, circuit 29S-LE23 (OG/WH), harness side and ground.  A0056736 • **Is the voltage greater than 10 volts?**	**Yes** GO to C5 . **No** REPAIR the circuit in question. CLEAR the DTCs. TEST the system for normal operation.
C5 CHECK CIRCUIT 31S-LE16 (BK/RD) (LH LOW BEAM) OR CIRCUIT 31S-LE23 (BK/WH) (RH LOW BEAM) FOR AN OPEN	
• Key in OFF position. • Disconnect: FEM C201a. • Measure the resistance between the FEM C201a-8, circuit 31S-LE16 (BK/RD), harness side and the LH headlamp C1021-4, circuit 31S-LE16 (BK/RD), harness side; or between the FEM C201a-7, circuit 31S-LE23 (BK/WH), harness side and the RH headlamp C1041-4, circuit 31S-LE23 (BK/WH), harness side.	**Yes** GO to C6 . **No** REPAIR the circuit in question. CLEAR the DTCs. TEST the system for normal operation.

 A0056737 • **Is the resistance less than 5 ohms?**	
C6 CHECK THE HEADLAMP ASSEMBLY	
• Connect: LH Headlamp C1021 or RH Headlamp C1041. • Connect a fused (10A) jumper wire between the FEM C201a-8, circuit 31S-LE16 (BK/RD) (LH headlamp), harness side and ground; or between the FEM C201a-7, circuit 31S-LE23 (BK/WH) (RH headlamp), harness side and ground.  A0056738 • Key in ON position. • **Does the inoperative low beam now illuminate?**	**Yes** GO to C13 . **No** REPAIR or INSTALL a new headlamp assembly. REFER to Headlamp Assembly in this section. TEST the system for normal operation.
C7 CHECK CIRCUIT 91S-LE16 (BN/YE) (LH LOW BEAM) OR CIRCUIT 91S-LE23 (BN/WH) (RH LOW BEAM) FOR SHORT TO POWER	
• Key in OFF position. • Disconnect: FEM C201b or C201f. • Disconnect: LH HID Relay C1379 or RH HID Relay C1380. • Key in ON position. • Measure the voltage between the FEM C201b-6, circuit 91S-LE16 (BN/YE) (LH headlamp), harness side and ground; or between the FEM C201f-20, circuit 91S-LE23 (BN/WH) (RH headlamp), harness side and ground.  A0056739 • **Is any voltage present?**	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to C8 .
C8 CHECK CIRCUIT 91S-LE16 (BN/YE) (LH LOW BEAM) OR CIRCUIT 91S-LE23 (BN/WH) (RH LOW BEAM) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the FEM C201b-6, circuit 91S-LE16 (BN/YE), harness side and the LH HID relay C1379-2, circuit 91S-LE16 (BN/YE), harness side; or	**Yes** GO to C9 . **No** REPAIR the circuit in question.

between the FEM C201f-20, circuit 91S-LE23 (BN/WH), harness side and the RH HID relay C1380-2, circuit 91S-LE23 (BN/WH), harness side.  • **Is the resistance less than 5 ohms?**	TEST the system for normal operation.
C9 CHECK CIRCUIT 29S-LE16 (OG/GN) (LH LOW BEAM) OR CIRCUIT 29S-LE23 (OG/WH) (RH LOW BEAM) FOR AN OPEN (HID HEADLAMP)	
• Key in ON position. • Measure the voltage between the LH HID relay C1379-1, circuit 29S-LE16 (OG/GN), harness side and ground; or between the RH HID relay C1380-1, circuit 29S-LE23 (OG/WH), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to C10 . **No** REPAIR the circuit in question. TEST the system for normal operation.
C10 CHECK THE HID RELAY	
• Carry out the HID relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the HID relay OK?**	**Yes** GO to C11 . **No** INSTALL a new HID relay. TEST the system for normal operation.
C11 CHECK CIRCUIT 30-LE31 (RD/YE) (LH LOW BEAM) OR CIRCUIT 30-LE30 (RD/BU) (RH LOW BEAM) FOR AN OPEN (HID HEADLAMP)	
• Key in OFF position. • Measure the voltage between the LH HID relay C1379-3, circuit 30-LE31 (RD/YE), harness side and ground; or between the RH HID relay C1380-3, circuit 30-LE30 (RD/BU), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to C12 .

C12 CHECK THE FEM	
• Connect: LH HID Relay C1379 or RH HID Relay C1380. • Connect a fused (10A) jumper wire between the FEM C201b-6, circuit 91S-LE16 (BN/YE) (LH headlamp), harness side and ground; or between the FEM C201f-20, circuit 91S-LE23 (BN/WH) (RH headlamp), harness side and ground.  A0056741 • Key in ON position. • **Does the inoperative low beam now illuminate?**	**Yes** REMOVE the jumper wire. GO to C13 . **No** REMOVE the jumper wire. GO to C14 .
C13 CHECK FOR FEM OPERATION	

• Key in OFF position.
• Disconnect all FEM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all FEM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FEM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

C14 CHECK CIRCUIT 30S-LE16 (RD/BK) (LH LOW BEAM) OR CIRCUIT 30S-LE23 (RD/WH) (RH LOW BEAM) FOR AN OPEN	
• Key in OFF position. • Connect: FEM C201a. • Disconnect: LH Headlamp C1021 or RH Headlamp C1041. • Place the headlamp switch in the headlamps ON position. • Measure the voltage between the LH headlamp C1021-1, circuit 30S-LE16 (RD/BK), harness side and ground; or between the RH headlamp C1041-1, circuit 30S-LE23 (RD/WH), harness side and ground.  A0056736 • **Is the voltage greater than 10 volts?**	**Yes** TURN the headlamp switch OFF. GO to C15 . **No** REPAIR the circuit in question. TEST the system for normal operation.
C15 CHECK CIRCUIT 31-LE16 (BK/RD) (LH LOW BEAM) OR CIRCUIT 31-LE23 (BK/WH) (RH LOW BEAM) FOR AN OPEN	

• Measure the resistance between the LH headlamp C1021-4, circuit 31-LE16 (BK/RD), harness side and ground; or between the RH headlamp C1041-4, circuit 31-LE23 (BK/WH), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new ballast. REFER to Headlamp Assembly in this section. TEST the system for normal operation. **No** REPAIR the circuit in question. TEST the system for normal operation.

Pinpoint Test D: One High Beam Headlamp Is Inoperative

Normal Operation

The LH high beam receives power through circuit 29S-LE15 (OG/BK). Ground for the LH low beam is provided through circuit 31S-LE15 (BK/GN). The RH high beam receives power through circuit 29S-LE22 (OG/GN). Ground for the RH low beam is provided through circuit 31S-LE22 (BK/GN). The front electronic module (FEM) controls the ground for both high beam headlamps.

Possible Causes

- circuit 29S-LE15 (OG/BK) (LH headlamp) open
- circuit 29S-LE22 (OG/GN) (RH headlamp) open
- circuit 31S-LE15 (BK/GN) (LH headlamp) open or short to power
- circuit 31S-LE22 (BK/RD) (RH headlamp) open or short to power
- FEM

PINPOINT TEST D: ONE HIGH BEAM HEADLAMP IS INOPERATIVE

Test Step	Result / Action to Take
D1 RETRIEVE THE FEM DIAGNOSTIC TROUBLE CODES (DTCs)	
NOTE: Make sure the headlamp switch is in the OFF position. • Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Carry out the FEM on-demand self-test. • **Are any DTCs present?**	**Yes** If DTC B1567, GO to D3 . All others, REFER to the FEM Diagnostic Trouble Code (DTC) index for correct diagnostics. **No** GO to D2 .
D2 CHECK CIRCUIT 31S-LE15 (BK/GN) OR CIRCUIT 31S-LE22 (BK/GN) FOR SHORT TO POWER	
• Key in OFF position. • Disconnect: FEM C201a. • Disconnect: LH Headlamp C1021 or RH Headlamp C1041. • Key in ON position.	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to D6 .

• Measure the voltage between the FEM C201a-17, circuit 31S-LE15 (BK/GN) (LH headlamp), harness side and ground; or between the FEM C201a-10, circuit 31S-LE22 (BK/RD) (RH headlamp), harness side and ground.  A0056743 • **Is any voltage present?**	
D3 CHECK CIRCUIT 29S-LE15 (OG/BK) OR CIRCUIT 29S-LE22 (OG/GN) FOR AN OPEN	
• Key in OFF position. • Disconnect: LH Headlamp C1021 or RH Headlamp C1041. • Key in ON position. • Measure the voltage between the LH headlamp C1021-3, circuit 29S-LE15 (OG/BK), harness side and ground; or between the RH headlamp C1041-3, circuit 29S-LE22 (OG/GN), harness side and ground.  A0056744 • **Is the voltage greater than 10 volts?**	**Yes** GO to D4 . **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.
D4 CHECK CIRCUIT 31S-LE15 (BK/GN) OR CIRCUIT 31S-LE22 (BK/RD) FOR AN OPEN	
• Key in OFF position. • Disconnect: FEM C201c. • Measure the resistance between the LH headlamp C1021-6, circuit 31S-LE15 (BK/GN), harness side and the FEM C201a-17, circuit 31S-LE15 (BK/GN), harness side; or the RH headlamp C1041-6, circuit 31S-LE22 (BK/RD), harness side and the FEM C201a-10, circuit 31S-LE22 (BK/RD), harness side.  A0062680 • **Is the resistance less than 5 ohms?**	**Yes** GO to D5 . **No** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation.
D5 CHECK THE HEADLAMP ASSEMBLY	

• Key in OFF position. • Connect: LH Headlamp C1021 or RH Headlamp C1041. • Key in ON position. • Connect a fused (10A) jumper wire between the FEM C201a-17, circuit 31S-LE15 (OG/BK), harness side and ground; or the between the FEM C201a-10, circuit 31S-LE22 (OG/GN), harness side and ground.  A0056746 • **Does the inoperative headlamp now illuminate?**	**Yes** GO to D6 . **No** REPAIR or INSTALL a new headlamp assembly. REFER to Headlamp Assembly in this section. CLEAR the DTCs. TEST the system for normal operation.
D6 CHECK FOR FEM OPERATION	

• Key in OFF position.
• Disconnect all FEM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all FEM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FEM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test E: The Headlamps Are On Continuously

Normal Operation

The instrument cluster monitors the headlamp switch position. When the headlamp switch is in the headlamps ON position, the instrument cluster sends a signal to the front electronic module (FEM) to illuminate the headlamps. If a problem is detected with the circuits to the headlamp switch, the instrument cluster will default the headlamps ON. The FEM controls the ground circuit for each halogen bulb and high intensity discharge (HID) relay (if equipped). If a problem is detected with any of the signal circuits to the headlamp switch, the instrument cluster will default the parking lamps and headlamps ON. The FEM controls the ground for the headlamp bulbs (and the HID relays if equipped).

Possible Causes

- circuit 31S-LE16 (BK/RD) (LH halogen low beam) short to ground
- circuit 31S-LE23 (BK/WH) (RH halogen low beam) short to ground
- circuit 91S-LE16 (BN/YE) (LH HID relay) short to ground
- circuit 91S-LE23 (BN/WH) (RH HID relay) short to ground
- circuit 31S-LE15 (BK/GN) (LH halogen high beam) short to ground
- circuit 31S-LE22 (BK/RD) (RH halogen high beam) short to ground
- circuit 8-LE21 (WH/GN) open, short to power or short to ground
- circuit 8-LF14 (WH/BU) open, short to power or short to ground
- circuit 9-LE29 (BN/GN) open or short to power
- circuit 10-LE21 (GY/OG) open, short to power or short to ground
- circuit 10-LE47 (GY/OG) short to ground
- HID relay

- headlamp switch
- instrument cluster
- FEM
- headlamp
- multifunction switch

PINPOINT TEST E: THE HEADLAMPS ARE ON CONTINUOUSLY

Test Step	Result / Action to Take
E1 DETERMINE THE ALWAYS ON HEADLAMP(S)	
NOTE: Make sure the multifunction switch is in the low beam position • Key in ON position. • Place the headlamp switch in the OFF position. • Observe the headlamps. • **Is only one lamp illuminated?**	**Yes** GO to E2 . **No** GO to E10 .
E2 RETRIEVE THE FEM DIAGNOSTIC TROUBLE CODES (DTCs)	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Carry out the FEM on-demand self-test. • **Are any DTCs present?**	**Yes** If DTC B1567, GO to E3 . If DTC B1794, GO to E5 . All others, REFER to the FEM Diagnostic Trouble Code (DTC) index for correct diagnostics. **No** If not equipped with HID headlamps, GO to E24 . If equipped with HID headlamps, GO to E7 .
E3 CHECK THE FEM (HIGH BEAM)	
• Key in OFF position. • Disconnect: FEM C201a. • **Does the LH or RH high beam continue to illuminate?**	**Yes** GO to E4 . **No** GO to E24 .
E4 CHECK CIRCUIT 31S-LE15 (BK/GN) OR 31S-LE22 (BK/RD) FOR SHORT TO GROUND	
• Disconnect: LH Headlamp C1021 or RH Headlamp C1041. • Measure the resistance between the LH headlamp C1021-6, circuit 31S-LE15 (BK/GN), harness side and ground; or between the RH headlamp C1041-6, circuit 31S-LE22 (BK/RD), harness side and ground.	**Yes** REPAIR the circuit in question. CLEAR the DTCs. TEST the system for normal operation. **No** REPAIR or INSTALL a new headlamp assembly. REFER to

 • **Is the resistance less than 5 ohms?**	Headlamp Assembly in this section. TEST the system for normal operation.
E5 CHECK THE FEM (HALOGEN LOW BEAM)	
• Key in OFF position. • Disconnect: FEM C201a. • **Does the LH or RH low beam continue to illuminate?**	**Yes** GO to E6 . **No** GO to E24 .
E6 CHECK CIRCUIT 31S-LE16 (BK/RD) OR 31S-LE23 (BK/WH) FOR SHORT TO GROUND	
• Disconnect: LH Headlamp C1021 or RH Headlamp C1041. • Measure the resistance between the LH headlamp C1021-4, circuit 31S-LE16 (BK/RD), harness side and ground; or between the RH headlamp C1041-4, circuit 31S-LE23 (BK/WH), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit in question. CLEAR the DTCs. TEST the system for normal operation. **No** REPAIR or INSTALL a new headlamp assembly. REFER to Headlamp Assembly in this section. TEST the system for normal operation.
E7 CHECK THE FEM (HID LOW BEAM)	
• Key in OFF position. • Disconnect: FEM C201a. • **Does the LH or RH low beam continue to illuminate?**	**Yes** GO to E8 . **No** GO to E24 .
E8 CHECK CIRCUIT 91S-LE16 (BN/YE) OR CIRCUIT 91S-LE23 (BN/WH) FOR SHORT TO GROUND	
• Disconnect: LH HID Relay C1379 or RH HID Relay C1380. • Measure the resistance between the LH HID relay C1379-2, circuit 91S-LE16 (BN/YE), harness side and ground; or between the RH HID relay C1380-2, circuit 91S-LE23 (BN/WH), harness side and ground	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to E9 .

 GN1455-A • **Is the resistance less than 5 ohms?**	
E9 CHECK THE HID RELAY	
• Carry out the HID relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the HID relay OK?**	**Yes** REPAIR circuit 30S-LE16 (RD/BK) (LH headlamp) or circuit 30S-LE23 (RD/WH) (RH headlamp). TEST the system for normal operation. **No** INSTALL a new HID relay. TEST the system for normal operation.
E10 DETERMINE IF LOW BEAMS OR HIGH BEAMS ARE ILLUMINATED	
• Key in OFF position. • Observe the headlamps. • **Are the high beam headlamps illuminated?**	**Yes** GO to E11 . **No** GO to E12 .
E11 MONITOR THE HIGH BEAM STATUS	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Monitor the instrument cluster high beam input status PID while moving the multifunction switch from the low beam to high beam positions. • **Does the PID agree with the positions of the multifunction switch?**	**Yes** GO to E24 . **No** INSTALL a new multifunction switch. REFER to Section 211-00 . TEST the system for normal operation.
E12 MONITOR THE HEADLAMP SWITCH STATUS	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Monitor the instrument cluster headlamp switch status PID while rotating the knob from the OFF position to the headlamps ON position. • **Does the PID agree with the positions of the headlamp switch?**	**Yes** GO to E24 . **No** GO to E13 .
E13 CHECK THE HEADLAMP SWITCH	
• Key in OFF position. • Disconnect: Headlamp Switch C205. • Carry out the headlamp switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information.	**Yes** GO to E14 . **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. TEST the system for normal

• **Is the headlamp switch OK?**	operation.
E14 CHECK CIRCUIT 8-LE21 (WH/GN) FOR AN OPEN OR SHORT TO GROUND	
• Disconnect: Instrument Cluster C220c. • Measure the resistance between the headlamp switch C205-10, circuit 8-LE21 (WH/GN), harness side and the instrument cluster C220c-10, circuit 8-LE21 (WH/GN), harness side; and between the headlamp switch C205-10, circuit 8-LE21 (WH/GN), harness side and ground.  A0056750 • **Is the resistance less than 5 ohms between the headlamp switch and the instrument cluster; and greater than 10,000 ohms between the headlamp switch and ground?**	**Yes** GO to E15 . **No** REPAIR the circuit. TEST the system for normal operation.
E15 CHECK CIRCUIT 8-LE21 (WH/GN) FOR SHORT TO POWER	
• Key in ON position. • Measure the voltage between the headlamp switch C205-10, circuit 8-LE21 (WH/GN), harness side and ground.  A0057871 • **Is the any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to E16 .
E16 CHECK CIRCUIT 8-LF14 (WH/BU) FOR AN OPEN OR SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between the headlamp switch C205-5, circuit 8-LF14 (WH/BU), harness side and the instrument cluster C220c-8, circuit 8-LF14 (WH/BU), harness side; and between the headlamp switch C205-5, circuit 8-LF14 (WH/BU), harness side and ground.  A0057872	**Yes** GO to E17 . **No** REPAIR the circuit. TEST the system for normal operation.

• **Is the resistance less than 5 ohms between the headlamp switch and the instrument cluster; and greater than 10,000 ohms between the headlamp switch and ground?**	
E17 CHECK CIRCUIT 8-LF14 (WH/BU) FOR SHORT TO POWER	
• Key in ON position. • Measure the voltage between the headlamp switch C205-5, circuit 8-LF14 (WH/BU), harness side and ground.  A0057873 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to E18 .
E18 CHECK CIRCUIT 10-LE21 (GY/OG) FOR AN OPEN OR SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between the headlamp switch C205-9, circuit 10-LE21 (GY/OG), harness side and the instrument cluster C220c-7, circuit 10-LE21 (GY/OG), harness side; and between the headlamp switch C205-9, circuit 10-LE21 (GY/OG), harness side and ground.  A0057874 • **Is the resistance less than 5 ohms between the headlamp switch and the instrument cluster; and greater than 10,000 ohms between the headlamp switch and ground?**	**Yes** GO to E19 . **No** REPAIR the circuit. TEST the system for normal operation.
E19 CHECK CIRCUIT 10-LE21 (GY/OG) FOR SHORT TO POWER	
• Key in ON position. • Measure the voltage between the headlamp switch C205-9, circuit 10-LE21 (GY/OG), harness side and ground.	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to E20 .

 A0059780 • **Is any voltage present?**	
E20 CHECK CIRCUIT 10-LE47 (GY/OG) FOR SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between the headlamp switch C205-4, circuit 10-LE47 (GY/OG), harness side and ground.  A0057870 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to E21 .
E21 CHECK CIRCUIT 9-LE29 (BN/GN) FOR AN OPEN	
• Measure the resistance between the headlamp switch C205-7, circuit 9-LE29 (BN/GN), harness side and the instrument cluster C220c-1, circuit 9-LE29 (BN/GN), harness side.  A0056749 • **Is the resistance less than 5 ohms?**	**Yes** GO to E22 . **No** REPAIR the circuit. TEST the system for normal operation.
E22 CHECK CIRCUIT 9-LE29 (BN/GN) FOR SHORT TO POWER	
• Key in ON position. • Measure the voltage between the headlamp switch C205-7, circuit 9-LE29 (BN/GN), harness side ground.  A0057875 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to E23 .
E23 CHECK FOR INSTRUMENT CLUSTER OPERATION	

• Key in OFF position.
• Disconnect all instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

E24 CHECK FOR FEM OPERATION	

• Key in OFF position.
• Disconnect all FEM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all FEM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FEM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: The Power Supply Relay Is Inoperative All Switched System Power (SSP) Features

Normal Operation

Battery voltage is supplied to the SSP relays through the battery junction box (BJB). Ground for the SSP relay coils is controlled by the front electronic module (FEM) and the rear electronic module (REM) through the following circuits: 31S-DG51 (BK/YE), 31S-DG55 (BK/RD), 31S-DG57 (BK/YE), 31S-DG53 (BK/OG), 31S-DK21 (BK/WH), 31S-DK30 (BK/OG). All of these circuits are spliced together so that either the FEM or the REM can ground this circuit and energize the SSP relays.

Possible Causes

- circuit 31S-DG51 (BK/YE) short to power
- circuit 31S-DG55 (BK/RD) short to power
- circuit 31S-DG57 (BK/YE) short to power
- circuit 31S-DG53 (BK/OG) short to power
- circuit 31S-DK21 (BK/WH) short to power
- circuit 31S-DK30 (BK/OG) short to power
- SSP relay
- BJB
- FEM
- REM

PINPOINT TEST F: THE POWER SUPPLY RELAY IS INOPERATIVE ALL SWITCHED SYSTEM POWER (SSP) FEATURES

Test Step	Result / Action to Take
NOTE: The ignition switch must be cycled from OFF to ON to enable the SSP feature.	

NOTE: Refer to Principles of Operation and the SSP Relay Index for complete detail of SSP-powered features.	
F1 CHECK THE BJB	
• Key in OFF position. • Disconnect: SSP1 Relay C441. • Measure the voltage between the SSP1 relay C441-86, circuit 30-DG51 (RD/YE), harness side and ground.  A0056752 • **Is the voltage greater than 10 volts?**	**Yes** GO to F2 . **No** REPAIR or INSTALL a new BJB. TEST the system for normal operation.
F2 CHECK THE CONTROL GROUND CIRCUIT FOR SHORT TO POWER	
• Key in ON position. • Measure the voltage between the SSP1 relay C441-85, circuit 31S-DG51 (BK/YE), harness side and ground.  A0056753 • **Is the voltage greater than 10 volts?**	**Yes** GO to F4 . **No** GO to F3 .
F3 CHECK FOR GROUND ON CIRCUIT 31S-DG51 (BK/YE)	
• Measure the resistance between the SSP1 relay C441-85, circuit 31S-DG51 (BK/YE), harness side and ground.  A0056754 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new SSP1 relay. TEST the system for normal operation. **No** REPAIR the circuit between the SSP relays and the electronic modules. TEST the system for normal operation.
F4 CHECK THE SSP RELAY(S)	
• Disconnect: SSP2 Relay C442. • Disconnect: SSP3 Relay C444. • Disconnect: SSP4 Relay C445.	**Yes** GO to F5 . **No** INSTALL a new SSP relay. TEST the system

• Carry out the relay component test on each SSP relay; Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Does each relay pass the component test?**	for normal operation.
F5 CHECK THE FEM FOR SHORT TO POWER	
• Key in OFF position. • Disconnect: FEM C201b. • Key in ON position. • Measure the voltage between the SSP1 relay C441-85, circuit 31S-DG51 (BK/YE), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to F6 . **No** GO to F7 .
F6 CHECK THE REM FOR SHORT TO POWER	
• Key in OFF position. • Disconnect: REM C420b. • Key in ON position. • Measure the voltage between the SSP1 relay C441-85, circuit 31S-DG51 (BK/YE), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** REPAIR the SSP ground control circuit. TEST the system for normal operation. **No** GO to F8 .
F7 CHECK FOR FEM OPERATION	

• Key in OFF position.
• Disconnect all FEM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all FEM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FEM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

F8 CHECK FOR REM OPERATION	

• Key in OFF position.
• Disconnect all REM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all REM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new REM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

Pinpoint Test G: The Power Supply Relay Is Inoperative Switched System Power (SSP) 1

Normal Operation

Battery voltage is supplied to the SSP1 relay through battery junction box (BJB) fuse 27 (30A). Ground for the relay coil is controlled by the front electronic module (FEM) and the rear electronic module (REM) through circuit 31S-DG51 (BK/YE). When the SSP1 relay is energized, battery voltage is switched from the BJB to circuit 30-DD3 (RD/OG).

Possible Causes

- circuit 31S-DG51 (BK/YE) open
- circuit 30-DD3 (RD/OG) open
- BJB
- SSP1 relay

PINPOINT TEST G: THE POWER SUPPLY RELAY IS INOPERATIVE SWITCHED SYSTEM POWER (SSP) 1

Test Step	Result / Action to Take
NOTE: The ignition switch must be cycled from OFF to ON to enable the SSP feature.	
NOTE: Refer to Exterior Lighting and the SSP Relay Index for complete details of SSP1 powered features.	
G1 CHECK THE BATTERY JUNCTION BOX (BJB)	
• Key in OFF position. • Disconnect: SSP1 Relay C441. • Measure the voltage between the SSP1 relay C441-86, circuit 30-DG51 (RD/YE), harness side and ground; and between the SSP1 relay C441-30, circuit 30-DG52 (RD/BU), harness side and ground.  • **Are the voltages greater than 10 volts?**	**Yes** GO to G2 . **No** REPAIR or INSTALL a new BJB. TEST the system for normal operation.
G2 CHECK CIRCUIT 31S-DG51 (BK/YE) FOR AN OPEN	

• Key in ON position. • Measure the resistance between the SSP1 relay C441-85, circuit 31S-DG51 (BK/YE), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** GO to G3 . **No** REPAIR the circuit. TEST the system for normal operation.
G3 CHECK THE SSP1 RELAY	
• Carry out the SSP1 relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the SSP1 relay OK?**	**Yes** REPAIR circuit 30-DD3 (RD/OG). **No** INSTALL a new SSP1 relay. TEST the system for normal operation.

Pinpoint Test H: The Power Supply Relay Is Inoperative Switched System Power (SSP) 2

Normal Operation

Battery voltage is supplied to the SSP2 relay through battery junction box (BJB) fuse 32 (30A). Ground for the relay coil is controlled by the front electronic module (FEM) and rear electronic module (REM) through circuit 31S-DG53 (BK/OG). When the SSP2 relay is energized, battery voltage is switched from the BJB to circuit 30-DD2 (RD/BU).

Possible Causes

- circuit 31S-DG53 (BK/OG) open
- circuit 30-DD2 (RD/BU) open
- BJB
- SSP2 relay

PINPOINT TEST H: THE POWER SUPPLY RELAY IS INOPERATIVE SWITCHED SYSTEM POWER (SSP) 2

Test Step	Result / Action to Take
NOTE: The ignition switch must be cycled from OFF to ON to enable the SSP feature.	
NOTE: Refer to Exterior Lighting and the SSP Relay Index for complete details of SSP1 powered features.	
H1 CHECK THE BATTERY JUNCTION BOX (BJB)	
• Key in OFF position. • Disconnect: SSP2 Relay C442. • Measure the voltage between the SSP2 relay C442-86, circuit 30-DG53 (RD/OG), harness side and ground; and between the SSP2 relay C442-30, circuit 30-DG54 (RD/GN), harness side and ground.	**Yes** GO to H2 . **No** REPAIR or INSTALL a new BJB. TEST the system for normal operation.

 • **Are the voltages greater than 10 volts?**	
H2 CHECK CIRCUIT 31S-DG53 (BK/OG) FOR AN OPEN	
• Key in ON position. • Measure the resistance between the SSP2 relay C442-85, circuit 31S-DG53 (BK/OG), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** GO to H3 . **No** REPAIR the circuit. TEST the system for normal operation.
H3 CHECK THE SSP2 RELAY	
• Carry out the SSP2 relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the SSP2 relay OK?**	**Yes** REPAIR circuit 30-DD2 (RD/BU). **No** INSTALL a new SSP2 relay. TEST the system for normal operation.

Pinpoint Test I: The Power Supply Relay Is Inoperative Switched System Power (SSP) 3

Normal Operation

Battery voltage is supplied to the SSP3 relay through battery junction box (BJB) fuse 24 (30A). Ground for the relay coil is controlled by the front electronic module (FEM) and rear electronic module (REM) through circuit 31S-DG55 (BK/RD). When the SSP3 relay is energized, battery voltage is switched from the BJB to circuit 30S-DB15 (RD/OG).

Possible Causes

- circuit 31S-DG55 (BK/RD) open
- circuit 30S-DB15 (RD/OG open
- BJB
- SSP3 relay

PINPOINT TEST I: THE POWER SUPPLY RELAY IS INOPERATIVE SWITCHED SYSTEM POWER (SSP) 3

Test Step	Result / Action to Take
NOTE: The ignition switch must be cycled from OFF to ON to enable the SSP feature.	

NOTE: Refer to Exterior Lighting and the SSP Relay Index for complete details of SSP1 powered features.	
I1 CHECK THE BATTERY JUNCTION BOX (BJB)	
• Key in OFF position. • Disconnect: SSP3 Relay C444. • Measure the voltage between the SSP3 relay C444-86, circuit 30-DG55 (RD/BK), harness side and ground; and between the SSP3 relay C444-30, circuit 30-DG56 (RD/WH), harness side and ground.  • **Are the voltages greater than 10 volts?**	**Yes** GO to I2 . **No** REPAIR or INSTALL a new BJB. TEST the system for normal operation.
I2 CHECK CIRCUIT 31S-DG55 (BK/RD) FOR AN OPEN	
• Key in ON position. • Measure the resistance between the SSP3 relay C444-85, circuit 31S-DG55 (BK/RD), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** GO to I3 . **No** REPAIR the circuit. TEST the system for normal operation.
I3 CHECK THE SSP3 RELAY	
• Carry out the SSP3 relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the SSP3 relay OK?**	**Yes** REPAIR circuit 30S-DB15 (RD/OG). **No** INSTALL a new SSP3 relay. TEST the system for normal operation.

Pinpoint Test J: The Power Supply Relay Is Inoperative Switched System Power (SSP) 4

Normal Operation

Battery voltage is supplied to the SSP4 relay through battery junction box (BJB) fuse 23 (30A). Ground for the relay coil is controlled by the front electronic module (FEM) and rear electronic module (REM) through circuit 31S-DG57 (BK/YE). When the SSP4 relay is energized, battery voltage is switched from the BJB to circuit 30S-DB16 (RD/GN).

Possible Causes

- circuit 31S-DG57 (BK/YE) open
- circuit 30S-DB16 (RD/GN) open

- BJB
- SSP4 relay

PINPOINT TEST J: THE POWER SUPPLY RELAY IS INOPERATIVE SWITCHED SYSTEM POWER (SSP) 4

Test Step	Result / Action to Take
NOTE: The ignition switch must be cycled from OFF to ON to enable the SSP feature.	
NOTE: Refer to Exterior Lighting and the SSP Relay Index for complete details of SSP1 powered features.	
J1 CHECK THE BATTERY JUNCTION BOX (BJB)	
• Key in OFF position. • Disconnect: SSP4 Relay C445. • Measure the voltage between the SSP4 relay C445-86, circuit 30-DG57 (RF/YE), harness side and ground; and between the SSP4 relay C445-30, circuit 30-DG58 (RD/BU), harness side and ground.  • **Are the voltages greater than 10 volts?**	**Yes** GO to J2 . **No** REPAIR or INSTALL a new BJB. TEST the system for normal operation.
J2 CHECK CIRCUIT 31S-DG57 (BK/YE) FOR AN OPEN	
• Key in ON position. • Measure the resistance between the SSP4 relay C445-85, circuit 31S-DG57 (BK/YE), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** GO to J3 . **No** REPAIR the circuit. TEST the system for normal operation.
J3 CHECK THE SSP4 RELAY	
• Carry out the SSP4 relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the SSP4 relay OK?**	**Yes** REPAIR circuit 30S-DB16 (RD/GN). **No** INSTALL a new SSP4 relay. TEST the system for normal operation.

Autolamps Printable View (97 KB)

Refer to Wiring Diagrams Cell 87 for schematic and connector information.

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052 or equivalent diagnostic tool with appropriate adapter cable

Inspection and Verification

1. Verify the customer concern
2. Visually inspect for obvious signs of mechanical or electrical damage.

   Visual Inspection Chart

Mechanical	Electrical
• Headlamp switch	• Circuitry • Photocell • Instrument cluster

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

4. If the cause is not visually evident, connect the diagnostic tool to the data link connector and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
   - check that the program card is correctly installed.
   - check the connections to the vehicle.
   - check the ignition switch position.
5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.
6. Carry out the diagnostic tool data link test. If the diagnostic tool responds with:

- SCP+, SCP-, ISO or UBP circuit fault; all electronic control units no response/not equipped, refer to Section 418-00 .
- No response/not equipped for instrument cluster, refer to Section 418-00 .
- System passed, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out self-test diagnostics for the instrument cluster.

7. If the DTCs retrieved are related to the concern, go to the Instrument Cluster Diagnostic Trouble Code (DTC) Index.

8. If multiple symptoms exist, check the Switched System Power (SSP) Relay Index before proceeding to the next step. Refer to Headlamps in this section.

9. If no DTCs related to the concern are retrieved, GO to Symptom Chart to continue diagnostics.

NOTE: For a complete master list of DTCs, refer to Section 418-00 .

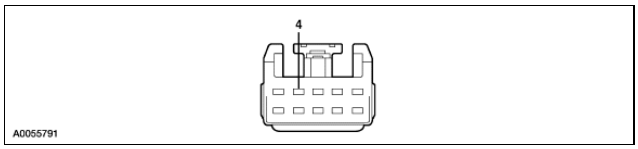
Instrument Cluster Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1342	ECU Is Defective	Instrument cluster	CLEAR and DOCUMENT the DTCs. CARRY OUT the instrument cluster Self-Test. INSTALL a new instrument cluster if DTC B1342 is retrieved again. REFER to Section 413-00 .
B1470	Lamp Headlamp Input Circuit Failure	Instrument cluster	Go To Pinpoint Test E .

Symptom Chart

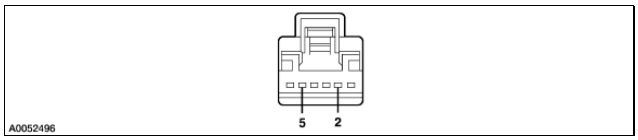
Symptom Chart
Connector Circuit Reference

Headlamp Switch C205



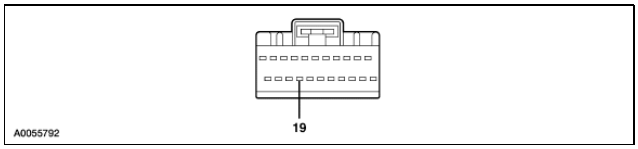
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
4	10-LE47 (GY/OG) autolamps ON input circuit	Less than 5 ohms between the headlamp switch and the instrument cluster. Greater than 10,000 ohms between the headlamp switch and ground.

Photocell C286



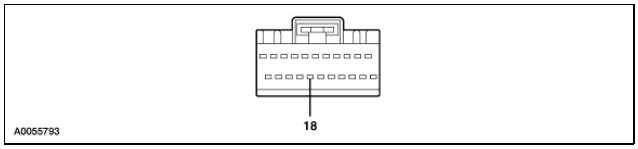
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
2	8-LE42 (WH/BU) photocell input circuit	Less than 5 ohms between the photocell and the instrument cluster. Greater than 10,000 ohms between the photocell and ground.
5	31-LE42 (BK/OG) photocell ground circuit	0 voltage, less than 5 ohms between the photocell and ground.

Instrument Cluster C220a



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
19	8-LE42 (WH/BU) photocell input circuit	0 voltage, less than 5 ohms between the instrument cluster and ground.

Instrument Cluster C220c



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
18	10-LE47 (GY/OG) autolamps ON input circuit	0 voltage, less than 5 ohms between the instrument cluster and the headlamp switch. Greater than 10,000 ohms between the instrument cluster and ground.

Pinpoint Test K: The Autolamps Are Inoperative

Normal Operation

The instrument cluster monitors the autolamps ON signal circuit to the headlamp switch through circuit 10-LE47 (GY/OG). When the headlamp switch is turned to the autolamps ON position, the signal is returned through circuit 9-LE29 (BN/GN). After the signal for the autolamps is received, the instrument cluster then monitors the photocell ambient light conditions by sending a signal to the photocell through circuit 8-LE42

(WH/BU). The photocell is grounded through circuit 31-LE42 (BK/OG). If a problem is detected with any of the voltage reference signals to the headlamp switch, the instrument cluster will default the headlamps and parking lamps ON.

Possible Causes

- circuit 8-LE42 (WH/BU) open or short to power
- circuit 10-LE47 (GY/OG) open or short to power
- circuit 31-LE42 (BK/OG) open
- photocell
- headlamp switch
- instrument cluster

PINPOINT TEST K: THE AUTOLAMPS ARE INOPERATIVE

Test Step	Result / Action to Take
K1 CHECK THE HEADLAMPS OPERATION	
• Place the headlamp switch in the headlamps ON position. • **Do the low beams illuminate?**	**Yes** GO to K2 . **No** REFER to Headlamps in this section to continue diagnostics.
K2 CHECK THE HEADLAMP SWITCH OUTPUT	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Monitor the instrument cluster headlamp switch status PID while rotating the knob to the autolamps ON position. • **Does the PID match with the headlamp switch position?**	**Yes** GO to K6 . **No** GO to K3 .
K3 CHECK THE HEADLAMP SWITCH	
• Key in OFF position. • Disconnect: Headlamp Switch C205. • Carry out the headlamp switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the headlamp switch OK?**	**Yes** GO to K4 . **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. TEST the system for normal operation.
K4 CHECK CIRCUIT 10-LE47 (GY/OG) FOR AN OPEN	
• Disconnect: Instrument Cluster C220c. • Measure the resistance between the instrument cluster C220c-18, circuit 10-LE47 (GY/OG), harness side and the headlamp switch C205-4, circuit 10-LE47 (GY/OG), harness side.	**Yes** GO to K5 . **No** REPAIR the circuit. TEST the system for normal operation.

 A0056756 • **Is the resistance less than 5 ohms?**	
K5 CHECK CIRCUIT 10-LE47 (GY/OG) FOR SHORT TO POWER	
• Measure the voltage between the instrument cluster C220c-18, circuit 10-LE47 (GY/OG), harness side and ground.  A0056757 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to K11 .
K6 CHECK PHOTOCELL INPUT	
• Monitor the instrument cluster photocell status PID while covering and then illuminating the photocell. • **Does the PID percentage change with the sensor covered and then illuminated?**	**Yes** GO to K11 . **No** GO to K7 .
K7 CHECK THE PHOTOCELL	
• Key in OFF position. • Disconnect: Photocell C286. • Key in ON position. • Monitor the instrument cluster photocell status PID while connecting and then disconnecting a fused (5A) jumper wire between the photocell C286-2, circuit 8-LE42 (WH/BU), harness side and the photocell C286-5, circuit 31-LE42 (BK/OG), harness side.  A0056758 • **Does the PID percentage change with the jumper wire connected and then disconnected?**	**Yes** INSTALL a new photocell. REFER to Photocell in this section. TEST the system for normal operation **No** GO to K8 .
K8 CHECK CIRCUIT 31-LE42 (BK/OG) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the photocell C286-5, circuit 31-LE42 (BK/OG), harness side and ground.	**Yes** GO to K9 . **No** REPAIR the circuit. TEST the system for normal

 A0056759 • **Is the resistance less than 5 ohms?**	operation.
K9 CHECK CIRCUIT 8-LE42 (WH/BU) FOR AN OPEN	
• Disconnect: Instrument Cluster C220a. • Measure the resistance between the instrument cluster C220a-19, circuit 8-LE42 (WH/BU), harness side and the photocell C286-2, circuit 8-LE42 (WH/BU), harness side.  A0056760 • **Is the resistance less than 5 ohms?**	**Yes** GO to K10 . **No** REPAIR the circuit. TEST the system for normal operation.
K10 CHECK CIRCUIT 8-LE42 (WH/BU) FOR SHORT TO POWER	
• Key in ON position. • Measure the voltage between the instrument cluster C220a-19, circuit 8-LE42 (WH/BU), harness side and ground.  A0057524 • **Is any voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to K11 .
K11 CHECK FOR INSTRUMENT CLUSTER OPERATION	

• Key in OFF position.
• Disconnect all instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

Pinpoint Test L: The Autolamps Are On Continuously

Normal Operation

The instrument cluster monitors a signal to the headlamp switch through circuit 10-LE47 (GY/OG). When the headlamp switch is turned to the autolamps ON position, the signal is returned through circuit 9-LE29 (BN/GN). After the signal for the autolamps is received, the instrument cluster monitors the photocell ambient light conditions by sending a signal to the photocell through circuit 8-LE42 (WH/BU).

Possible Causes

- circuit 8-LE42 (WH/BU) short to ground
- circuit 10-LE47 (GY/OG) short to ground
- photocell
- headlamp switch
- instrument cluster

PINPOINT TEST L: THE AUTOLAMPS ARE ON CONTINUOUSLY

Test Step	Result / Action to Take
L1 CHECK THE HEADLAMP SWITCH OUTPUT	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Monitor the instrument cluster headlamp switch status PID while rotating the headlamp switch knob from the autolamps ON to OFF positions. • **Does the PID match with the headlamp switch position?**	**Yes** GO to L4 . **No** GO to L2 .
L2 CHECK THE HEADLAMP SWITCH	
• Key in OFF position. • Disconnect: Headlamp Switch C205. • Carry out the headlamp switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the headlamp switch OK?**	**Yes** GO to L3 . **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. TEST the system for normal operation.
L3 CHECK CIRCUIT 10-LE47 (GY/OG) FOR SHORT TO GROUND	
• Disconnect: Instrument Cluster C220c. • Measure the resistance between the instrument cluster C220c-18, circuit 10-LE47 (GY/OG), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to L7 .
L4 CHECK THE OPERATION OF THE PHOTOCELL	

SENSOR	
• Monitor the instrument cluster photocell status PID while covering and then illuminating the photocell. • **Does the PID percentage change with the sensor covered and then illuminated?**	**Yes** GO to L7 . **No** GO to L5 .
L5 CHECK THE PHOTOCELL	
• Key in OFF position. • Disconnect: Photocell C286. • Key in ON position. • Monitor the instrument cluster photocell status PID while connecting and then disconnecting a fused (5A) jumper wire between the photocell C286-2, circuit 8-LE42 (WH/BU), harness side and the photocell C286-5, circuit 31-LE42 (BK/OG), harness side.  A0056758 • **Does the PID percentage change with the jumper wire connected and then disconnected?**	**Yes** INSTALL a new photocell. REFER to Photocell in this section. TEST the system for normal operation **No** GO to L6 .
L6 CHECK CIRCUIT 8-LE42 (WH/BU) FOR SHORT TO GROUND	
• Key in OFF position. • Disconnect: Instrument Cluster C220a. • Measure the resistance between the instrument cluster C220a-19, circuit 8-LE42 (WH/BU), harness side and ground.  A0057526 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to L7 .
L7 CHECK FOR INSTRUMENT CLUSTER OPERATION	

• Key in OFF position.
• Disconnect all instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded

	connector. REPEAT the self-test.

   Visual Inspection Chart

Mechanical	Electrical
• Brake pedal position (BPP) switch	• Battery junction box (BJB) fuses: ♦ 3 (5A) (LH stoplamp) ♦ 7 (5A) (RH stoplamp) ♦ 8 (5A) (high mounted stoplamp) • Central junction box (CJB) fuses 35 (5A) (brake pedal position [BPP] switch) • Circuitry • Rear electronic module (REM) • Interactive vehicle dynamics (IVD) module • Anti-lock brake system (ABS) module • Electric parking brake module • Bulbs

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

4. If the cause is not visually evident, connect the diagnostic tool to the data link connector and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
   - check that the program card is correctly installed.

- check the connections to the vehicle.
- check the ignition switch position.

5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

6. Carry out the diagnostic tool data link test. If the diagnostic tool responds with:
   - SCP+, SCP-, ISO or UBP circuit fault; all electronic control units no response/not equipped, refer to Section 418-00 .
   - No response/not equipped for REM, refer to Section 418-00 .
   - System passed, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out self-test diagnostics for the REM.

7. If the DTCs retrieved are related to the concern, go to the Rear Electronic Module (REM) Diagnostic Trouble Code (DTC) Index.

8. If multiple symptoms exist, check the Switched System Power (SSP) Relay Index before proceeding to the next step. Refer to Headlamps in this section.

9. If no DTCs related to the concern are retrieved, GO to Symptom Chart to continue diagnostics.

NOTE: For a complete master list of DTCs, refer to Section 418-00 .

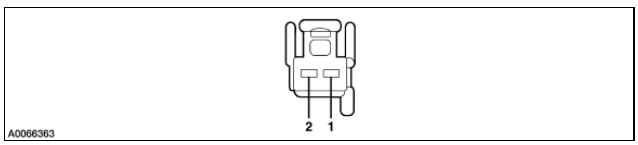
Rear Electronic Module (REM) Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1342	ECU Is Defective	REM	CLEAR and DOCUMENT the DTCs. CARRY OUT the REM self-test. INSTALL a new REM if DTC B1342 is retrieved again. REFER to Section 418-00 .
B1483	Brake Pedal Input Circuit Failure	REM	Go To Pinpoint Test O .

Symptom Chart

Symptom Chart
Connector Circuit Reference

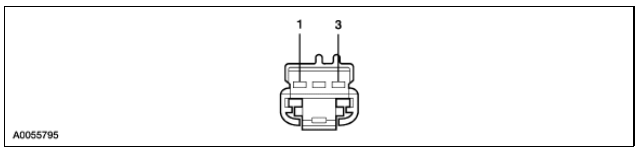
BPP Switch C278



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1		Greater than 10 volts with the ignition in any position.

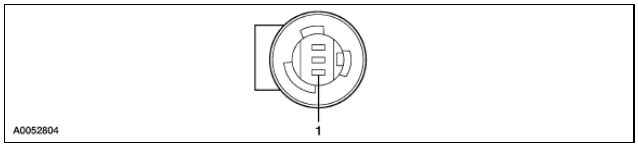
	29-CF58 (OG/GN) B+ power supply circuit	
2	29S-CF1 (OG/YE) switched power supply circuit to REM or IVD module	0 voltage, less than 5 ohms between the BPP switch and the REM (if not equipped with IVD) or less than 5 ohms between the BPP switch and the IVD module (if equipped).

High Mounted Stoplamp C302



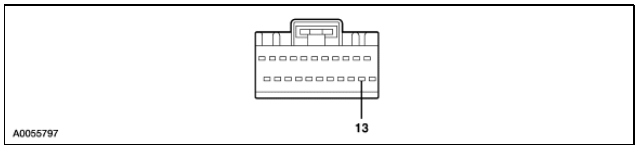
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	31S-LG6A (BK/YE) high mounted stoplamp control ground circuit	0 voltage, less than 5 ohms between the high mounted stoplamp and the REM.
3	29S-LG6A (OG/YE) switched power supply circuit	Greater than 10 volts with the ignition switch ON.

LH Combination Lamp C414, RH Combination Lamp C417



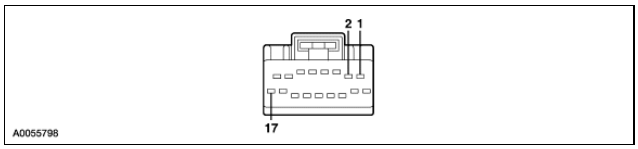
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	29S-LF23 (OG) rear lamp switched power supply circuit	Greater than 10 volts with the ignition ON.

REM C420b



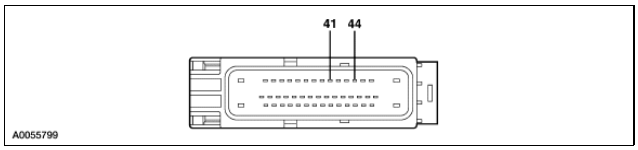
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
13	29S-DK30 (OG) BPP switch output circuit	0 voltage, Greater than 10 volts when the brake pedal is applied. Less than 5 ohms between the REM and the BPP switch (if equipped without IVD). Less than 5 ohms between the REM and the IVD module (if equipped with IVD). Greater than 10,000 ohms between the REM and ground.

REM C420e



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	31S-LG21 (BK/GN) RH rear stoplamp control ground circuit	0 voltage, less than 5 ohms between the REM and the RH rear stoplamp. Greater than 10 volts when the ignition switch is ON.
2	31S-LG14 (BK/OG) LH rear stoplamp control ground circuit	0 voltage, less than 5 ohms between the REM and the LH rear stoplamp. Greater than 10 volts when the ignition switch is ON.
17	31S-LG6 (BK/YE) high mounted stoplamp control ground circuit	0 voltage, less than 5 ohms between the REM and the high mounted stoplamp. Greater than 10 volts when the ignition switch is ON.

IVD Module C155



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
41	29S-CF1 (OG/YE) BPP switch input circuit	0 voltage, less than 5 ohms between the IVD module and the BPP switch. Greater than 10 volts when the brake pedal is applied.
44	29S-CF2 (OG/BU) IVD module brakes applied output circuit	0 voltage, less than 5 ohms between the IVD module and the REM. Greater than 10,000 ohms between the IVD module and ground.

Pinpoint Test M: The Stoplamps Are Inoperative

Normal Operation Vehicles Without Interactive Vehicle Dynamics (IVD)

The stoplamps ground circuits are independently controlled by the rear electronic module (REM). The brake pedal position switch (BPP) is supplied battery voltage through circuit 29-CF58 (OG/GN). When the brake pedal is pressed, the BPP switch allows voltage to flow through to circuit 29S-CF1 (OG/YE). Circuit 29S-CF1 (OG/YE) is spliced to carry the voltage to the anti-lock brake system (ABS) module, the powertrain control module (PCM) and the rear electronic module (REM). Voltage to the REM (from the BPP switch) after the splice is carried through circuit 29S-DK30 (OG). When the REM receives voltage from the BPP switch, the REM illuminates the stoplamps.

Normal Operation Vehicles With IVD

The stoplamps ground circuits are independently controlled by the rear electronic module (REM). The brake pedal position switch (BPP) is supplied battery voltage through circuit 29-CF58 (OG/GN). When the brake pedal is pressed, the BPP switch allows voltage to flow through circuit 29S-CF1 (OG/YE) to the IVD module. The IVD module then sends voltage through circuit 29S-CF2 (OG/BU), which is spliced to carry the voltage to the powertrain control module (PCM) and the rear electronic module (REM). Voltage to the REM (from the IVD module) after the splice is carried through circuit 29S-DK30 (OG). When the REM receives voltage from the IVD module, the REM illuminates the stoplamps.

Possible Causes

- circuit 29-CF58 (OG/GN) open
- circuit 29S-CF1 (OG/YE) open
- circuit 29S-CF2 (OG/BU) open or shorted to ground
- circuit 29S-DK30 (OG) open or shorted to ground
- BPP switch
- REM
- IVD module

PINPOINT TEST M: THE STOPLAMPS ARE INOPERATIVE

Test Step	Result / Action to Take
M1 CHECK THE BPP SWITCH INPUT	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Monitor the REM BPP switch status PID while pressing and releasing the brake pedal. • **Does the PID indicate active with the brake pedal pressed and inactive with the brake pedal released?**	**Yes** GO to M8 . **No** GO to M2 .
M2 CHECK CIRCUIT 29-CF58 (OG/GN) FOR AN OPEN	
• Key in OFF position. • Disconnect: BPP Switch C278. • Measure the voltage between the BPP switch C278-1, circuit 29-CF58 (OG/GN), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to M3 . **No** REPAIR the circuit. TEST the system for normal operation.
M3 CHECK THE BPP SWITCH	

• Connect a fused (5A) jumper wire between the BPP switch C278-1, circuit 29-CF58 (OG/GN), harness side and the BPP switch C278-2, circuit 29S-CF1 (OG/YE), harness side.  A0057528 • **Do the stoplamps illuminate?**	**Yes** INSTALL a new BPP switch. REFER to Brake Pedal Position (BPP) Switch in this section. TEST the system for normal operation. **No** If not equipped with IVD, GO to M4 . If equipped with IVD, GO to M5 .
M4 CHECK THE BPP SWITCH INPUT CIRCUIT TO THE REM	
• Connect: BPP Switch C278. • Disconnect: REM C420b. • Measure the voltage between the REM C420b-13, circuit 29S-DK30 (OG), harness side and ground while pressing the brake pedal.  A0057529 • **Is the voltage greater than 10 volts?**	**Yes** GO to M8 . **No** REPAIR the BPP input circuit between the REM and BPP switch. TEST the system for normal operation.
M5 CHECK THE BPP SWITCH OUTPUT CIRCUIT TO THE IVD MODULE	
• Disconnect: IVD Module C155. • Measure the voltage between the IVD module C155-41, circuit 29S-CF1 (OG/YE), harness side and ground while pressing the brake pedal.  A0057530 • **Is the voltage greater than 10 volts?**	**Yes** GO to M6 . **No** REPAIR the BPP input circuit between the IVD module and BPP switch. TEST the system for normal operation.
M6 CHECK THE IVD MODULE	
• Connect a fused (5A) jumper wire between the IVD module C155-41, circuit 29S-CF1 (OG/YE), harness side and the IVD module C155-44, circuit 29S-CF2 (OG/BU), harness side.	**Yes** GO to M9 . **No** LEAVE the jumper wire connected. GO to M7 .

 A0057531 • Press the brake pedal and observe the stoplamps. • **Do the stoplamps illuminate?**	
M7 CHECK THE IVD MODULE OUTPUT CIRCUIT TO THE REM	
• Disconnect: REM C420b. • Measure the voltage between the REM C420b-13, circuit 29S-DK30 (OG), harness side and ground while pressing the brake pedal.  A0057529 • **Is the voltage greater than 10 volts?**	**Yes** GO to M8 . **No** REPAIR circuit 29S-CF2 (OG/BU) or 29S-DK30 (OG). TEST the system for normal operation.
M8 CHECK FOR REM OPERATION	

• Key in OFF position.
• Disconnect all REM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all REM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new REM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

M9 CHECK FOR IVD MODULE OPERATION	

• Key in OFF position.
• Disconnect the IVD module connector.
• Check for:
  • corrosion
  • pushed-out pins
• Connect the IVD module connector and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new IVD module. REFER to Section 206-09 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

Pinpoint Test N: One Or More Stoplamps Are Inoperative

Normal Operation

Each stoplamp is supplied battery voltage independently. Power from the battery junction box (BJB) flows through circuit 29S-LG6 (OG/YE) to circuit 29S-LG6A (OG/YE) and then on to the high mounted stoplamp.

Power from the BJB flows through circuit 29S-LF23 (OG) to the LH stoplamp. Power from the BJB flows through circuit 29S-LF24 (OG/BK) to circuit 29S-LF23 (OG) and then on to the RH stoplamp. The stoplamps ground circuits are independently controlled by the rear electronic module (REM). When the REM receives voltage from the BPP switch (or IVD module if equipped), the REM grounds circuits 31S-LG6 (BK/YE) (high mounted stoplamp), 31S-LG14 (BK/OG) (LH stoplamp) and 31S-LG21 (BK/GN) (RH stoplamp) to illuminate the stoplamps.

Possible Causes

- circuit 29S-LG6 (OG/YE) open
- circuit 29S-LG6A (OG/YE) open
- circuit 29S-LF23 (OG) open
- circuit 29S-LF24 (OG/BK) open
- circuit 31S-LG6 (BK/YE) open or short to power
- circuit 31S-LG6A (BK/YE) open or short to power
- circuit 31S-LG14 (BK/OG) open or short to power
- circuit 31S-LG21 (BK/GN) open or short to power
- high mounted stoplamp
- REM

PINPOINT TEST N: ONE OR MORE STOPLAMPS ARE INOPERATIVE

Test Step	Result / Action to Take
N1 DETERMINE THE INOPERATIVE STOPLAMP(S)	
• Key in ON position. • Press the brake pedal and observe the stoplamps. • **Are all the stoplamps inoperative?**	**Yes** Go To Pinpoint Test M . **No** If the LH or RH stoplamp is inoperative, GO to N2 . If the high mounted stoplamp is inoperative, GO to N4 .
N2 CHECK THE VOLTAGE TO THE INOPERATIVE STOPLAMP	
• Key in OFF position. • Disconnect: LH Combination Lamp C414 or RH Combination Lamp C417. • Key in ON position. • Measure the voltage between the LH combination lamp C414-1, circuit 29S-LF23 (OG), harness side and ground; or between the RH combination lamp C417-1, circuit 29S-LF23 (OG), harness side and ground.  A0057532	**Yes** RECONNECT the combination lamp. GO to N3 . **No** REPAIR circuit 29S-LF23 (OG) or circuit 29S-LF24 (OG/BK) as necessary. TEST the system for normal operation.

• **Is the voltage greater than 10 volts?**	
N3 CHECK THE REM	
• Disconnect: REM C420e. • **NOTE:** If the fuse in the jumper wire fails, repair the circuit for short to power. • Connect a fused (5A) jumper wire between the REM C420e-2 (LH stoplamp), circuit 31S-LG14 (BK/OG), harness side and ground; or between the REM C420e-1 (RH stoplamp), circuit 31S-LG21 (BK/GN), harness side and ground.  A0057533 • **Does the inoperative stoplamp now illuminate?**	**Yes** GO to N7 . **No** REPAIR circuit 31S-LG14 (BK/OG) or 31S-LG21 (BK/GN) as necessary. TEST the system for normal operation.
N4 CHECK FOR POWER TO THE HIGH MOUNTED STOPLAMP	
• Key in OFF position. • Disconnect: High Mounted Stoplamp C302. • Measure the voltage between high mounted stoplamp C302-3, circuit 29S-LG6A (OG/YE), harness side and ground.  A0057534 • **Is the voltage greater than 10 volts?**	**Yes** RECONNECT the high mounted stoplamp. GO to N5 . **No** REPAIR circuit 29S-LG6A (OG/YE) or 29S-LG6 (OG/YE) as necessary. TEST the system for normal operation.
N5 CHECK THE REAR ELECTRONIC MODULE (REM) (HIGH MOUNTED STOPLAMP)	
• Disconnect: REM C420e. • **NOTE:** If the fuse in the jumper wire fails, repair the circuit for short to power. • Connect a fused (5A) jumper wire between the REM C420e-17 (high mounted stoplamp), circuit 31S-LG6 (BK/YE), harness side and ground.  A0057535 • **Does the high mounted stoplamp now illuminate?**	**Yes** GO to N7 . **No** LEAVE the jumper wire connected. GO to N6 .

N6 CHECK CIRCUITS 31S-LG6 (BK/YE) AND 31S-LG6A (BK/YE) FOR AN OPEN	
• Disconnect: High Mounted Stoplamp C302. • Measure the resistance between the high mounted stoplamp C302-1, circuit 31S-LG6A (BK/YE), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new high mounted stoplamp. REFER to High Mounted Stoplamp in this section. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
N7 CHECK FOR REM OPERATION	

• Key in OFF position.
• Disconnect all REM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all REM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new REM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

Pinpoint Test O: The Stoplamps Are On Continuously

Normal Operation Vehicles Equipped Without Interactive Vehicle Dynamics (IVD)

Each stoplamp is supplied battery voltage independently. The stoplamp ground circuits are independently controlled by the rear electronic module (REM). When the brake pedal is pressed, the BPP switch allows voltage to flow through to circuit 29S-CF1 (OG/YE). Circuit 29S-CF1 (OG/YE) is spliced to carry the voltage to the anti-lock brake system (ABS) module, the powertrain control module (PCM) and the rear electronic module (REM). Voltage to the REM (from the BPP switch) after the splice is carried through circuit 29S-DK30 (OG). When the REM receives voltage from the BPP switch, the REM grounds circuits 31S-LG6 (BK/YE) (high mounted stoplamp), 31S-LG14 (BK/OG) (LH stoplamp) and 31S-LG21 (BK/GN) (RH stoplamp) to illuminate the stoplamps. The electric parking brake can also trigger the stoplamps by communicating to the REM (via the SCP link) that the parking brake has been actuated while the vehicle is moving.

Normal Operation Vehicles Equipped With IVD

Each stoplamp is supplied battery voltage independently. The stoplamp ground circuits are independently controlled by the rear electronic module (REM). When the brake pedal is pressed, the BPP switch allows voltage to flow through circuit 29S-CF1 (OG/YE) to the IVD module. The IVD module then sends voltage through circuit 29S-CF2 (OG/BU), which is spliced to carry the voltage to the powertrain control module (PCM) and the rear electronic module (REM). Voltage to the REM (from the IVD module) after the splice is carried through circuit 29S-DK30 (OG). When the REM receives voltage from the IVD module, the REM grounds circuits 31S-LG6 (BK/YE) (high mounted stoplamp), 31S-LG14 (BK/OG) (LH stoplamp) and 31S-LG21 (BK/GN) (RH stoplamp) to illuminate the stoplamps. The electric parking brake can also trigger the stoplamps by communicating to the REM (via the SCP link) that the parking brake has been actuated

while the vehicle is moving.

Possible Causes

- circuit 29S-CF1 (OG/YE) short to power
- circuit 29S-CF2 (OG/BU) short to power
- circuit 29S-CF58 (OG/GN) short to power
- circuit 29S-DK30 (OG) short to power
- circuit 29S-RE13 (OG) short to power
- circuit 31S-LG6 (BK/YE) short to ground
- circuit 31S-LG6A (BK/YE) short to ground
- circuit 31S-LG14 (BK/OG) short to ground
- circuit 31S-LG21 (BK/GN) short to ground
- BPP switch
- IVD module
- ABS module
- PCM
- REM
- electric parking brake module

PINPOINT TEST O: THE STOPLAMPS ARE ON CONTINUOUSLY

Test Step	Result / Action to Take
O1 DETERMINE THE ALWAYS ON STOPLAMPS	
• Observe the stoplamps. • **Are all the stoplamps illuminated?**	**Yes** GO to O3 . **No** GO to O2 .
O2 CHECK THE CONTROL GROUND CIRCUIT FOR SHORT TO GROUND	
• Key in OFF position. • Disconnect: REM C420e. • **Does the lamp continue to illuminate?**	**Yes** For the high mounted stoplamp, REPAIR circuit 31S-LG6 (BK/YE) or 31S-LG6A (BK/YE) as necessary. TEST the system for normal operation. For the LH stoplamp, REPAIR circuit 31S-LG14 (BK/OG). TEST the system for normal operation. For the RH stoplamp, REPAIR circuit 31S-LG21 (BK/GN) or 31S-LG14 (BK/OG) as necessary. TEST the system for normal operation. **No** GO to O10 .
O3 CHECK THE BPP SWITCH	
• Key in OFF position. • Disconnect: BPP Switch C278.	**Yes** If equipped with IVD, GO to O4 . If not equipped with IVD, GO to O6 .

• **Do the stoplamps continue to illuminate?**	**No** INSTALL a new BPP switch. REFER to Brake Pedal Position (BPP) Switch in this section. CLEAR the DTCs. TEST the system for normal operation.
O4 CHECK THE IVD MODULE	
• Disconnect: IVD Module C155. • **Do the stoplamps continue to illuminate?**	**Yes** GO to O6 . **No** GO to O5 .
O5 CHECK CIRCUIT 29S-CF1 (OG/YE) FOR SHORT TO POWER	
• Measure the voltage between the BPP switch C278-2, circuit 29S-CF1 (OG/YE), harness side and ground.  • **Is any voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation. **No** GO to O11 .
O6 CHECK THE ABS MODULE	
• Disconnect: ABS Module C135. • **Do the stoplamps continue to illuminate?**	**Yes** GO to O7 . **No** GO to O12 .
O7 CHECK THE ELECTRIC PARKING BRAKE MODULE	
• Disconnect: Electric Parking Brake Module C4206. • **Do the stoplamps continue to illuminate?**	**Yes** GO to O8 . **No** GO to O13 .
O8 CHECK THE PCM	
• Disconnect: PCM C175a. • **Do the stoplamps continue to illuminate?**	**Yes** GO to O9 . **No** GO to O14 .
O9 CHECK THE REM	
• Disconnect: REM C420b. • **Do the stoplamps continue to illuminate?**	**Yes** REPAIR circuit 29S-DK30 (OG), 29S-CF1 (OG/YE), 29S-CF2 (OG/BU), 29S-CF58 (OG/GN) or 29S-RE13 (OG) as necessary. CLEAR the DTCs. TEST the system for normal operation.

	No GO to O10 .
O10 CHECK FOR REM OPERATION	

• Key in OFF position.
• Disconnect all REM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all REM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new REM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

O11 CHECK FOR IVD MODULE OPERATION	

• Key in OFF position.
• Disconnect all IVD module connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all IVD module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new IVD module. REFER to Section 206-09 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

O12 CHECK FOR ABS MODULE OPERATION	

• Key in OFF position.
• Disconnect all ABS module connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all ABS module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ABS module. REFER to Section 206-09 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

O13 CHECK FOR ELECTRIC PARKING BRAKE MODULE OPERATION	

• Key in OFF position.
• Disconnect all electric parking brake module connectors.
• Check for:
  • corrosion
  • pushed-out pins
	Yes
	INSTALL a new electric parking brake module. REFER to Section 206-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern

• Connect all electric parking brake module connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	may have been caused by a loose or corroded connector. REPEAT the self-test.
O14 CHECK FOR PCM OPERATION	

• Key in OFF position.
• Disconnect all PCM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-04A or Section 303-04B . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

Turn Signal and Hazard Lamps Printable View (130 KB)

Refer to Wiring Diagrams Cell 90 for schematic and connector information.

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052 or equivalent diagnostic tool with appropriate adapter cable

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Multifunction switch	• Battery junction box (BJB) fuses: ♦ 2 (10A) (RH rear turn signal lamp) ♦ 6 (10A) (LH rear turn signal lamp) • Central junction box (CJB) fuses: ♦ 8 (5A) (RH front parking/turn lamp) ♦ 10 (5A) (LH front parking/turn lamp) • Circuitry • Bulbs • Front electronic module (FEM) • Rear electronic module (REM) • Instrument cluster

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

4. If the cause is not visually evident, connect the diagnostic tool to the data link connector and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
   - check that the program card is correctly installed.
   - check the connections to the vehicle.
   - check the ignition switch position.

5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

6. Carry out the diagnostic tool data link test. If the diagnostic tool responds with:
   - SCP+, SCP-, ISO or UBP circuit fault; all electronic control units no response/not equipped, refer to Section 418-00 .
   - No response/not equipped for FEM, refer to Section 418-00 .
   - No response/not equipped for REM, refer to Section 418-00 .
   - No response/not equipped for instrument cluster, refer to Section 418-00 .
   - System passed, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out self-test diagnostics for the FEM.

7. If the DTCs retrieved are related to the concern, go to the Front Electronic Module (FEM) Diagnostic Trouble Code (DTC) Index, Rear Electronic Module (REM) Diagnostic Trouble Code (DTC) Index or Instrument Cluster Diagnostic Trouble Code (DTC) Index.

8. If multiple symptoms exist, check the Switched System Power (SSP) Relay Index before proceeding to the next step. Refer to Headlamps in this section.

9. If no DTCs related to the concern are retrieved, GO to Symptom Chart to continue diagnostics.

NOTE: For a complete master list of DTCs, refer to Section 418-00 .

Front Electronic Module (FEM) Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1342	ECU Is Defective	FEM	CLEAR the DTCs. RETRIEVE the DTCs. If DTC B1342 is retrieved, INSTALL a new FEM. REFER to Section 418-00 .
B1499	Lamp Turn Signal Left Circuit Failure	FEM	If inoperative, Go To Pinpoint Test Q . If always on, Go To Pinpoint Test R .
B1501	Lamp Turn Signal Left Circuit Short to Battery	FEM	Go To Pinpoint Test Q .
B1503	Lamp Turn Signal Right Circuit Failure	FEM	If inoperative, Go To Pinpoint Test Q . If always on, Go To Pinpoint Test R .
B1505	Lamp Turn Signal Right Circuit Short to Battery	FEM	Go To Pinpoint Test Q .

Rear Electronic Module (REM) Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1342	ECU Is Defective	REM	CLEAR and DOCUMENT the DTCs. CARRY OUT the instrument cluster self-test. INSTALL a new REM if DTC B1342 is retrieved again. REFER to Section 418-00 .
B1499	Lamp Turn Signal Left Circuit Failure	REM	If inoperative, Go To Pinpoint Test Q . If always on, Go To Pinpoint Test R .
B1501	Lamp Turn Signal Left Circuit Short to Battery	REM	Go To Pinpoint Test Q .
B1503	Lamp Turn Signal Right Circuit Failure	REM	If inoperative, Go To Pinpoint Test Q . If always on, Go To Pinpoint Test R .
B1505	Lamp Turn Signal Right Circuit Short to Battery	REM	Go To Pinpoint Test Q .

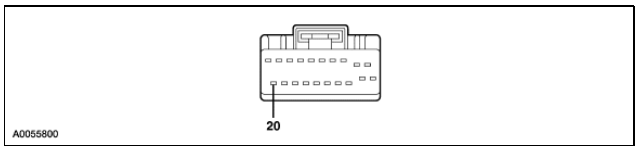
Instrument Cluster Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1342	ECU Is Defective	Instrument cluster	CLEAR and DOCUMENT the DTCs. CARRY OUT the instrument cluster Self-Test. INSTALL a new instrument cluster if DTC B1342 is retrieved again. REFER to Section 413-00 .
B1875	Turn Signal/Hazard Switch Signal Circuit Failure	Instrument cluster	Go To Pinpoint Test S

Symptom Chart

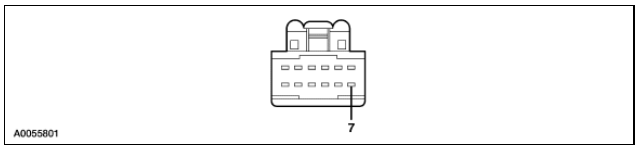
Symptom Chart
Connector Circuit Reference

Instrument Cluster C220b



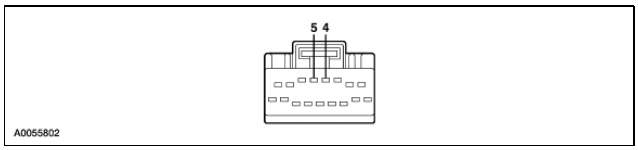
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
20	8-LG43 (WH/VT) multifunction switch signal output circuit	0 voltage, less than 5 ohms between the instrument cluster and the multifunction switch. Greater than 10,000 ohms between the instrument cluster and ground.

Multifunction Switch C202



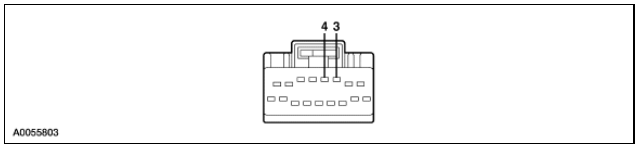
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
7	8-LG43 (WH/VT) multifunction switch signal output circuit	Less than 5 ohms between the multifunction switch and the instrument cluster. Greater than 10,000 ohms between the instrument cluster and ground.

FEM C201a



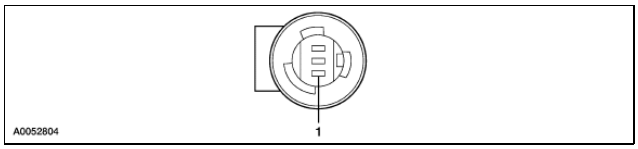
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
4	31S-LG18 (BK/YE) RH front turn signal lamp control ground circuit	Less than 5 ohms between the FEM and the RH front turn signal lamp. Greater than 10 volts with the ignition switch ON.
5	31S-LG11 (BK/WH) LH front turn signal lamp control ground circuit	Less than 5 ohms between the FEM and the LH front turn signal lamp. Greater than 10 volts with the ignition switch ON.

REM C420e



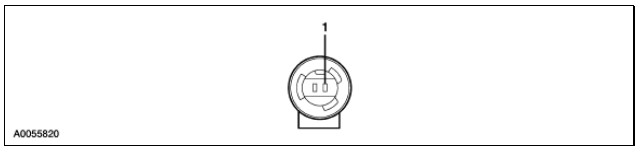
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
3	31S-LG12 (BK/YE) LH rear turn signal lamp control ground circuit	Less than 5 ohms between the REM and the LH rear turn signal lamp. Greater than 10 volts with the ignition switch ON.
4	31S-LG19 (BK/BU) RH rear turn signal lamp control ground circuit	Less than 5 ohms between the REM and the RH rear turn signal lamp. Greater than 10 volts with the ignition switch ON.

LH Front Turn Signal Lamp C1023, RH Front Turn Signal Lamp C1043



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	29S-LF16 (OG/GN) switched B+ circuit	Greater than 10 volts with the ignition switch ON.

LH Rear Turn Signal Lamp C413, RH Rear Turn Signal Lamp C416



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	29S-LG12 (OG/YE) switched B+ circuit	Greater than 10 volts with the ignition switch ON.

Pinpoint Test P: The Turn Signal Lamps Are Inoperative

Normal Operation

The instrument cluster sends out a voltage reference signal through circuit 8-LG43 (WH/VT) to the multifunction switch. The return signal is carried through circuit 9-LG43 (BN/WH) (shared with the high beam circuit) back to the instrument cluster. When the multifunction switch is placed in the RH or LH turn positions, the voltage signal sent by the instrument cluster passes through a resistor within the multifunction switch (specific to LH and RH turn positions) before returning to instrument cluster.

Possible Causes

- circuit 8-LG43 (WH/VT) open or short to power
- multifunction switch
- instrument cluster

PINPOINT TEST P: THE TURN SIGNAL LAMPS ARE INOPERATIVE

Test Step	Result / Action to Take
P1 CHECK THE HIGH BEAM OPERATION	
• Key in ON position. • Turn the headlamp switch to the headlamps ON position. • Place the multifunction switch in the high beam position. • **Do the high beams operate correctly?**	**Yes** TURN the headlamp switch OFF. GO to P2 . **No** Go To Pinpoint Test B to diagnose the high beams.

P2 CHECK THE MULTIFUNCTION SWITCH OUTPUT	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Monitor the instrument cluster turn signal status PID while placing the multifunction switch in the RH and then LH turn positions. • **Does the PID match with the multifunction switch positions?**	**Yes** GO to P6 . **No** GO to P3 .
P3 CHECK THE MULTIFUNCTION SWITCH	
• Key in OFF position. • Disconnect: Multifunction Switch C202. • Carry out the multifunction switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the multifunction switch OK?**	**Yes** GO to P4 . **No** INSTALL a new multifunction switch. REFER to Section 211-00 . TEST the system for normal operation.
P4 CHECK CIRCUIT 8-LG43 (WH/VT) FOR AN OPEN	
• Disconnect: Instrument Cluster C220b. • Measure the resistance between the instrument cluster C220b-20, circuit 8-LG43 (WH/VT), harness side and the multifunction switch C202-7, circuit 8-LG43 (WH/VT), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to P5 . **No** REPAIR the circuit. TEST the system for normal operation.
P5 CHECK CIRCUIT 8-LG43 (WH/VT) FOR SHORT TO POWER	
• Key in ON position. • Measure the voltage between the instrument cluster C220b-20, circuit 8-LG43 (WH/VT), harness side and ground.  • **Is any voltage present?**	**Yes** GO to P6 . **No** REPAIR the circuit. TEST the system for normal operation.

P6 CHECK FOR INSTRUMENT CLUSTER OPERATION	

• Key in OFF position.
• Disconnect all instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

Pinpoint Test Q: One Turn Signal Lamp Is Inoperative

Normal Operation

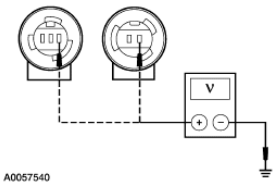
Power is supplied from the central junction box (CJB) to the LH front turn signal lamp through circuits 29S-LF3 (OG/YE) and 29S-LF7 (OG/BU). The ground for the LH front turn signal lamp is passed through circuit 31S-LG18 (BK/YE) and then through circuit 31S-LG11 (BK/WH) to the front electronic module (FEM). Power is supplied from the CJB to the RH front turn signal lamp through circuits 29S-LF4 (OG/BU) and 29S-LF16 (OG/GN). The ground for the RH front turn signal lamp is passed through circuit 31S-LG18 (BK/YE) to the FEM. Power is supplied from the battery junction box (BJB) to the LH rear turn signal lamp through circuits 29S-LG1 (OG/YE) and 29S-LG12 (OG/YE). The ground for the LH rear turn signal lamp is passed through circuit 31S-LG12 (BK/YE) to the rear electronic module (REM). Power is supplied from the BJB to the RH rear turn signal lamp through circuits 29S-LG2 (OG/BU), 29S-LG19 (OG/BU) and 29S-LG12 (OG/YE). The ground for the RH rear turn signal lamp is passed through circuit 31S-LG12 (BK/YE) and then through circuit 31S-LG19 (BK/BU) to the REM. The FEM and REM individually control the ground circuits for the turn signal lamps. The timed on/off cycle is determined in the instrument cluster programming and is set to flash approximately 80 times per minute if both the front and rear turn signal lamps are good. If only one turn signal lamp is good, the instrument cluster will flash the remaining working turn signal lamp(s) approximately 160 times per minute.

Possible Causes

- circuit 29S-LF3 (OG/YE) open
- circuit 29S-LF7 (OG/BU) open
- circuit 31S-LG18 (BK/YE) open or short to power
- circuit 31S-LG11 (BK/WH) open or short to power
- circuit 29S-LF4 (OG/BU) open
- circuit 29S-LF16 (OG/GN) open
- circuit 29S-LG1 (OG/YE) open
- circuit 29S-LG12 (OG/YE) open
- circuit 31S-LG12 (BK/YE) open or short to power
- circuit 29S-LG2 (OG/BU) open
- circuit 29S-LG19 (OG/BU) open
- circuit 31S-LG19 (BK/BU) open or short to power
- FEM
- REM

PINPOINT TEST Q: ONE TURN SIGNAL LAMP IS INOPERATIVE

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>Q1 CHECK THE POWER SUPPLY TO THE TURN SIGNAL LAMP</td><td></td></tr>
<tr><td>
• Key in OFF position.
• Disconnect: Inoperative Turn Signal Lamp.
• Key in ON position.
• Measure the voltage between the inoperative lamp and ground as follows:
<table>
<tr><th>Inoperative Turn Signal Lamp Connector-Pin</th><th>Circuit</th></tr>
<tr><td>LH front parking/turn signal lamp C1023-1</td><td>29S-LF16 (OG/GN)</td></tr>
<tr><td>RH front parking/turn signal lamp C1043-1</td><td>29S-LF16 (OG/GN)</td></tr>
<tr><td>LH rear turn signal lamp C413-1</td><td>29S-LG12 (OG/YE)</td></tr>
<tr><td>RH rear signal lamp C416-1</td><td>29S-LG12 (OG/YE)</td></tr>
</table>

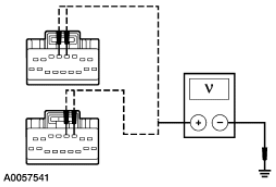


• Is the voltage greater than 10 volts?
</td><td>Yes
GO to Q2 .

No
REPAIR the circuit in question. CLEAR the DTCs. TEST the system for normal operation.</td></tr>
<tr><td>Q2 CHECK THE CONTROL GROUND CIRCUIT FOR SHORT TO POWER</td><td></td></tr>
<tr><td>
• Key in OFF position.
• Disconnect: FEM C201a or REM C420e.
• Measure the voltage between the FEM or REM and ground as follows:
<table>
<tr><th>Inoperative Turn Signal Lamp</th><th>FEM or REM Connector</th><th>Circuit</th></tr>
<tr><td>LH front parking/turn signal lamp</td><td>FEM C201a-5</td><td>31S-LG11 (BK/WH)</td></tr>
<tr><td></td><td>FEM C201a-4</td><td></td></tr>
</table>
</td><td>Yes
REPAIR the circuit in question. CLEAR the DTCs. TEST the system for normal operation.

No
GO to Q3 .</td></tr>
</table>

RH front parking/turn signal lamp		31S-LG18 (BK/YE)
LH rear turn signal lamp	REM C420e-3	31S-LG12 (BK/YE)
RH rear turn signal lamp	REM C420e-4	31S-LG19 (BK/BU)

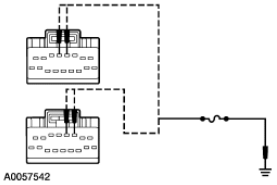


- **Is any voltage present?**

Q3 CHECK THE CONTROL GROUND CIRCUIT FOR AN OPEN

- Connect: Inoperative Turn Signal Lamp.
- Key in ON position.
- Connect a fused (5A) jumper wire between the FEM or REM and ground as follows:

Inoperative Turn Signal Lamp	FEM or REM Connector	Circuit
LH front parking/turn signal lamp	FEM C201a-5	31S-LG11 (BK/WH)
RH front parking/turn signal lamp	FEM C201a-4	31S-LG18 (BK/YE)
LH rear turn signal lamp	REM C420e-3	31S-LG12 (BK/YE)
RH rear turn signal lamp	REM C420e-4	31S-LG19 (BK/BU)



- **Does the inoperative lamp now illuminate?**

Yes
For the front turn signal lamp, GO to Q4 .

For the rear turn signal lamp, GO to Q5 .

No
REPAIR the circuit in question. CLEAR the DTCs. TEST the system for normal operation.

Q4 CHECK FOR FEM OPERATION

- Key in OFF position.
- Disconnect all FEM connectors.

Yes
INSTALL a new FEM. REFER to Section 418-00 . TEST the system for normal

• Check for: • corrosion • pushed-out pins • Connect all FEM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.
Q5 CHECK FOR REM OPERATION	
• Key in OFF position. • Disconnect all REM connectors. • Check for: • corrosion • pushed-out pins • Connect all REM connectors and make sure they seat correctly. • Operate the system and verify the concern is still present. • **Is the concern still present?**	**Yes** INSTALL a new REM. REFER to Section 418-00 . TEST the system for normal operation. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

Pinpoint Test R: One Turn Signal Lamp Is Always On

Normal Operation

Power is supplied from the central junction box (CJB) to the LH front turn signal lamp through circuits 29S-LF3 (OG/YE) and 29S-LF7 (OG/BU). The ground for the LH front turn signal lamp is passed through circuit 31S-LG18 (BK/YE) and then through circuit 31S-LG11 (BK/WH) to the front electronic module (FEM). Power is supplied from the CJB to the RF turn signal lamp through circuits 29S-LF4 (OG/BU) and 29S-LF16 (OG/GN). The ground for the RH front turn signal lamp is passed through circuit 31S-LG18 (BK/YE) to the FEM. Power is supplied from the battery junction box (BJB) to the LH rear turn signal lamp through circuits 29S-LG1 (OG/YE) and 29S-LG12 (OG/YE). The ground for the LH rear turn signal lamp is passed through circuit 31S-LG12 (BK/YE) to the rear electronic module (REM). Power is supplied from the BJB to the RH rear turn signal lamp through circuits 29S-LG2 (OG/BU), 29S-LG19 (OG/BU) and 29S-LG12 (OG/YE). The ground for the RH rear turn signal lamp is passed through circuit 31S-LG12 (BK/YE) and then through circuit 31S-LG19 (BK/BU) to the REM. The FEM and REM individually control the ground circuits for the turn signal lamps. The timed on/off cycle is determined in the instrument cluster programming and is set to flash approximately 80 times per minute if both the front and rear turn signal lamps are good. If only one turn signal lamp is good, the instrument cluster will flash the remaining working turn signal lamp(s) approximately 160 times per minute.

Possible Causes

- circuit 31S-LG18 (BK/YE) short to ground
- circuit 31S-LG11 (BK/WH) short to ground
- circuit 31S-LG12 (BK/YE) short to ground
- circuit 31S-LG19 (BK/BU) short to ground
- FEM
- REM

PINPOINT TEST R: ONE TURN SIGNAL LAMP IS ALWAYS ON

Test Step	Result / Action to Take
R1 CHECK THE CONTROL GROUND CIRCUIT FOR SHORT TO GROUND	
• Key in OFF position. • Disconnect: FEM C201a or REM C420e. • Key in ON position. • Observe the turn signal lamp after disconnecting the FEM (front turn signal lamp always on) or REM (rear turn signal lamp always on). • **Does the lamp continue to illuminate?**	**Yes** REPAIR the control ground circuit in question. CLEAR the DTCs. TEST the system for normal operation. **No** If front turn signal lamp, GO to R2 . If rear turn signal lamp, GO to R3 .
R2 CHECK FOR FEM OPERATION	

• Key in OFF position.
• Disconnect all FEM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all FEM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FEM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

R3 CHECK FOR REM OPERATION	

• Key in OFF position.
• Disconnect all REM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all REM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new REM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

Pinpoint Test S: The Hazard Lamps Are Always On

Normal Operation

The instrument cluster sends out a voltage reference signal through circuit 8-LG43 (WH/VT) to the multifunction switch. The return signal is carried through circuit 9-LG43 (BN/WH) (shared with the high beam circuit) back to the instrument cluster. When the hazard switch is engaged, the voltage signal sent by the instrument cluster passes directly through the multifunction switch and returns to the instrument cluster.

Possible Causes

- circuit 8-LG43 (WH/VT) short to ground
- multifunction switch
- instrument cluster

PINPOINT TEST S: THE HAZARD LAMPS ARE ALWAYS ON

Test Step	Result / Action to Take
S1 CHECK THE MULTIFUNCTION SWITCH	
• Key in OFF position. • Disconnect: Multifunction Switch C202. • Carry out the multifunction switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the multifunction switch OK?**	**Yes** GO to S2 . **No** INSTALL a new multifunction switch. REFER to Section 211-00 . CLEAR the DTCs. TEST the system for normal operation.
S2 CHECK CIRCUIT 8-LG43 (WH/VT) FOR SHORT TO GROUND	
• Disconnect: Instrument Cluster C220b. • Measure the resistance between the multifunction switch C202-7, circuit 8-LG43 (WH/VT), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit. CLEAR the DTCs. TEST the system for normal operation. **No** GO to S3 .
S3 CHECK FOR INSTRUMENT CLUSTER OPERATION	

• Key in OFF position.
• Disconnect all instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

Parking, Rear and License Lamps Printable View (125 KB)

Refer to Wiring Diagrams Cell 92 for schematic and connector information.

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052 or equivalent diagnostic tool with appropriate adapter cable

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Headlamp switch	• Battery junction box (BJB) fuses: ♦ 2 (10A) (license plate lamps) ♦ 3 (5A) (LH rear parking lamp) ♦ 7 (5A) (RH rear parking lamp) • Central junction box (CJB) fuses: ♦ 8 (5A) (RH front side marker and parking lamp) ♦ 10 (5A) (LH front side marker and parking lamp) • Circuitry • Bulbs • Front electronic module (FEM) • Rear electronic module (REM) • Instrument cluster

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

4. If the cause is not visually evident, connect the diagnostic tool to the data link connector and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
   - check that the program card is correctly installed.
   - check the connections to the vehicle.
   - check the ignition switch position.

5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

6. Carry out the diagnostic tool data link test. If the diagnostic tool responds with:
   - SCP+, SCP-, ISO or UBP circuit fault; all electronic control units no response/not equipped, refer to Section 418-00 .
   - No response/not equipped for FEM, refer to Section 418-00 .
   - No reponse/not equipped for REM, refer to Section 418-00 .
   - No response/not equipped for instrument cluster, refer to Section 418-00 .
   - System passed, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out self-test diagnostics for the FEM.

7. If the DTCs retrieved are related to the concern, go to Front Electronic Module (FEM) Diagnostic Trouble Code (DTC) Index, Rear Electronic Module (REM) Diagnostic Trouble Code (DTC) Index or Instrument Cluster Diagnostic Trouble Code (DTC) Index.

8. If multiple symptoms exist, check the Switched System Power (SSP) Relay Index before proceeding to the next step. Refer to Headlamps in this section.

9. If no DTCs related to the concern are retrieved, GO to Symptom Chart to continue diagnostics.

NOTE: For a complete master list of DTCs, refer to Section 418-00 .

Front Electronic Module (FEM) Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1342	ECU Is Defective	FEM	CLEAR the DTCs. RETRIEVE the DTCs. If DTC B1342 is retrieved, INSTALL a new FEM. REFER to Section 418-00 .

Rear Electronic Module (REM) Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1342	ECU Is Defective	REM	CLEAR and DOCUMENT the DTCs. CARRY OUT the instrument cluster self-test. INSTALL a new REM if DTC B1342 is retrieved again. REFER to Section 418-00 .

Instrument Cluster Diagnostic Trouble Code (DTC) Index

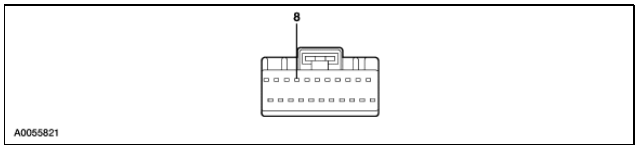
DTC	Description	Source	Action
B1342	ECU Is Defective	Instrument cluster	CLEAR and DOCUMENT the DTCs. CARRY OUT the instrument cluster Self-Test. INSTALL a new instrument cluster if DTC B1342 is retrieved again. REFER to Section 413-00 .
B1470	Lamp Headlamp Input Circuit Failure	Instrument cluster	Go To Pinpoint Test E .

Symptom Chart

Symptom Chart

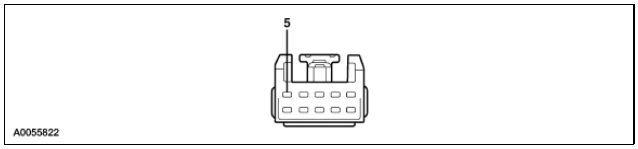
Connector Circuit Reference

Instrument Cluster C220c



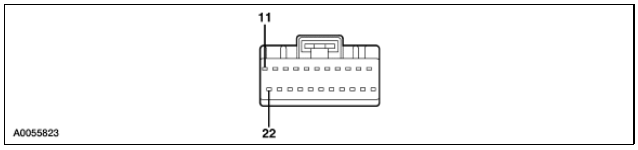
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
8	8-LF14 (WH/BU) instrument cluster parking lamps input signal	0 voltage, less than 5 ohms between the instrument cluster and the headlamp switch.

Headlamp Switch C205



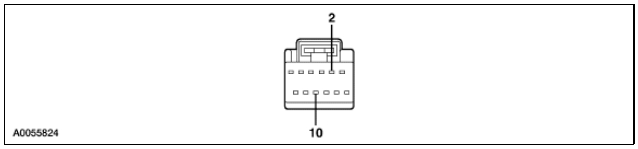
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
5	8-LF14 (WH/BU) instrument cluster parking lamps input signal	Less than 5 ohms between the headlamp switch and headlamp switch. Greater than 10,000 ohms between the headlamp switch and ground

FEM C201b



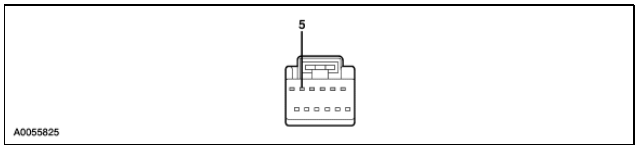
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
11	31S-LF17 (BK/WH) RH front side marker lamp control ground circuit	Less than 5 ohms between the FEM and the RH front side marker lamp. Greater than 10 volts with the ignition ON.
22	31S-LF8 (BK/OG) LH front side marker lamp control ground circuit	Less than 5 ohms between the FEM and the LH front side marker lamp. Greater than 10 volts with the ignition ON.

FEM C201c



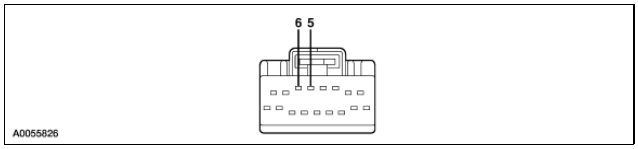
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
2	31S-LF7 (BK/BU) LH front parking lamp control ground circuit	Less than 5 ohms between the FEM and the LH parking marker lamp. Greater than 10 volts with the ignition ON.
10	31S-LF16 (BK/RD) RH front parking lamp control ground circuit	Less than 5 ohms between the FEM and the RH front parking lamp. Greater than 10 volts with the ignition ON.

REM C420a



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
5	31S-LF12 (BK/GN) license lamps control ground circuit	Less than 5 ohms between the REM and the license lamps. Greater than 10 volts with the ignition ON.

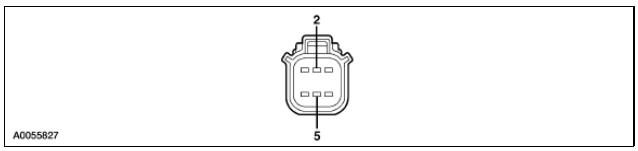
REM C420e



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
5		

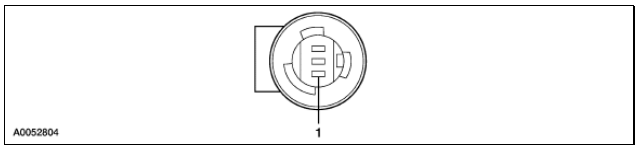
	31S-LF20 (BK/OG) RH rear parking lamp control ground circuit	Less than 5 ohms between the FEM and the RH rear parking lamp. Greater than 10 volts with the ignition ON.
6	31S-LF11 (BK/WH) LH rear parking lamp control ground circuit	Less than 5 ohms between the FEM and the LH rear parking lamp. Greater than 10 volts with the ignition ON.

LH Headlamp C1021, RH Headlamp C1041



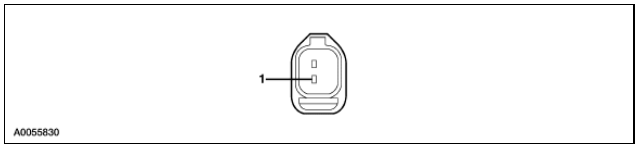
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
2 (C1021)	29S-LF8 (OG) switched B+ supply circuit	Greater than 10 volts with the ignition ON.
5 (C1021)	31S-LF8 (BK/OG) side marker control ground circuit	0 voltage, less than 5 ohms between the headlamp and the FEM. Greater than 10,000 ohms between the headlamp and ground.
2 (C1041)	29S-LF17 (OG/WH) switched B+ supply circuit	Greater than 10 volts with the ignition ON.
5 (C1041)	31S-LF17 (BK/WH) side marker control ground circuit	0 voltage, less than 5 ohms between the headlamp and the FEM. Greater than 10,000 ohms between the headlamp and ground.

LH Front Parking/Turn Lamp C1023, RH Front Parking/Turn Lamp C1043, LH Rear Parking Lamp C414, RH Rear Parking Lamp C417



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1 (C1023, C1043)	29S-LF16 (OG/GN) switched B+ supply circuit	Greater than 10 volts with the ignition ON.
1 (C414, C417)	29S-LF23 (OG) switched B+ supply circuit	Greater than 10 volts with the ignition ON.

LH License Lamp C452, RH License Lamp C462



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1 (C452)	29S-LF21 (OG/BK) switched B+ supply circuit	Greater than 10 volts with the ignition switch ON.
1 (C462)	29S-LF22 (OG/BK) switched B+ supply circuit	Greater than 10 volts with the ignition switch ON.

Pinpoint Test T: The Exterior Lamps Are Inoperative

Normal Operation

The instrument cluster monitors the headlamp switch position by sending out voltage reference signals to the headlamp switch. If a problem is detected with the circuits to the headlamp switch, the instrument cluster will default the headlamps and parking lamps on. When the headlamp switch is in the parking lamps ON position, the instrument cluster sends a signal to the front electronic module (FEM) and the rear electronic module (REM) to illuminate the parking lamps.

Possible Causes

- circuit 8-LF14 (WH/BU) open
- headlamp switch
- instrument cluster

PINPOINT TEST T: THE EXTERIOR LAMPS ARE INOPERATIVE

Test Step	Result / Action to Take
T1 CHECK THE HEADLAMP SWITCH OUTPUT	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Monitor the instrument cluster headlamp switch status PID while rotating the knob to the parking lamps ON position. • **Does the PID match with the headlamp switch position?**	**Yes** GO to T4 . **No** GO to T2 .
T2 CHECK THE HEADLAMP SWITCH	
• Key in OFF position. • Disconnect: Headlamp Switch C205. • Carry out the headlamp switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the headlamp switch OK?**	**Yes** GO to T3 . **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. TEST the system for normal operation.
T3 CHECK CIRCUIT 8-LF14 (WH/BU) FOR AN OPEN	

• Disconnect: Instrument Cluster C220c. • Measure the resistance between the instrument cluster C220c-8, circuit 8-LF14 (WH/BU), harness side and the headlamp switch C205-5, circuit 8-LF14 (WH/BU), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to T4 . **No** REPAIR the circuit. TEST the system for normal operation.
T4 CHECK FOR INSTRUMENT CLUSTER OPERATION	

• Key in OFF position.
• Disconnect all instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

Pinpoint Test U: One Or More Parking, Rear Or License Lamp Is Inoperative

Normal Operation

Power is supplied to the LH front side marker and parking lamp through circuits 29S-LF3 (OG/YE), 29S-LF7 (OG/BU), 29S-LF8 (OG) and 29S-LF16 (OG/GN). Ground for the LH front side marker flows through circuit 31S-LF8 (BK/OG) to the front electronic module (FEM). Ground for the LH front parking lamp flows through circuit 31S-LF16 (BK/RD) and then through circuit 31S-LF7 (BK/BU) to the FEM. Power is supplied to the RH front side marker and parking lamp through circuits 29S-LF4 (OG/BU), 29S-LF17 (OG/WH) and 29S-LF16 (OG/GN). Ground for the RH front side marker flows through circuit 31S-LF17 (BK/WH) to the FEM. Ground for the RH front parking lamp flows through circuit 31S-LF16 (BK/RD) to the FEM. Power is supplied to the LH rear parking lamp through circuit 29S-LF23 (OG). Ground for the LH rear parking lamp flows through circuit 31S-LF11 (BK/WH) to the rear electronic module (REM). Power is supplied to the RH rear parking lamp through circuits 29S-LF24 (OG/BK), and 29S-LF23 (OG). Ground for the RH rear parking lamp flows through circuit 31S-LF11 (BK/WH) and then circuit 31S-LF20 (BK/OG) to the REM. Power is supplied to the license lamps through circuits 29S-LG2 (OG/BU), 29S-LF12 (OG/BK), 29S-LF21 (OG/BK) and 29S-LF22 (OG/BK). Ground for the license lamps flows through circuits 31S-LF21 (BK/GN) and 31S-LF22 (BK/GN) and then through circuit 31S-LF12 (BK/GN) to the REM. The FEM and REM control the ground circuits individually for the lamps (the license lamps share a common ground controlled circuit at the REM).

Possible Causes

- circuit 29S-LF8 (OG) open
- circuit 29S-LF16 (OG/GN) open
- circuit 31S-LF8 (BK/OG) open or short to power
- circuit 31S-LF16 (BK/RD) open or short to power
- circuit 31S-LF7 (BK/BU) open or short to power

- circuit 29S-LF17 (OG/WH) open
- circuit 31S-LF17 (BK/WH) open or short to power
- circuit 29S-LF23 (OG) open
- circuit 31S-LF11 (BK/WH) open or short to power
- circuit 31S-LF20 (BK/OG) open or short to power
- circuit 29S-LF21 (OG/BK) open
- circuit 29S-LF22 (OG/BK) open
- circuit 31S-LF12 (BK/GN) open or short to power
- REM
- FEM
- Headlamp

PINPOINT TEST U: ONE OR MORE PARKING, REAR OR LICENSE LAMPS ARE INOPERATIVE

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>
<tr><td>U1 CHECK FOR VOLTAGE TO THE INOPERATIVE LAMP(S)</td><td></td></tr>
<tr><td>

Key in OFF position.
Disconnect: Inoperative Lamp.
Key in ON position.
Measure the voltage between the inoperative lamp and ground as follows:

<table>
<tr><th>Inoperative Lamp</th><th>Connector-Pin</th><th>Circuit</th></tr>
<tr><td>LH front side marker</td><td>Headlamp C1021-2</td><td>29S-LF8 (OG)</td></tr>
<tr><td>RH front side marker</td><td>Headlamp C1041-2</td><td>29S-LF17 (OG/WH)</td></tr>
<tr><td>LH front parking/turn signal lamp</td><td>C1023-1</td><td>29S-LF16 (OG/GN)</td></tr>
<tr><td>RH front parking/turn signal lamp</td><td>C1043-1</td><td>29S-LF16 (OG/GN)</td></tr>

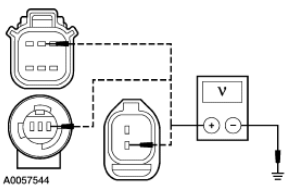
<tr><td>LH license plate lamp</td><td>C452-1</td><td>29S-LF21 (OG/BK)</td></tr>
<tr><td>RH license plate lamp</td><td>C462-1</td><td>29S-LF22 (OG/BK)</td></tr>
</table>



Is the voltage greater than 10 volts?

</td><td>Yes
GO to U2 .

No
REPAIR the power supply circuit as necessary. TEST the system for normal operation.</td></tr>
</table>

U2 CHECK THE CONTROL GROUND CIRCUIT FOR SHORT TO POWER

- Key in OFF position.
- Disconnect: FEM C201b or C201c.
- Disconnect: REM C420a or C420e.
- Key in ON position.
- Measure the voltage between the FEM or REM as follows:

Inoperative Lamp	Connector-Pin	Circuit
LH front side marker	FEM C201b-22	31S-LF8 (BK/OG)
RH front side marker	FEM C201b-11	31S-LF17 (BK/WH)
LH front parking/turn signal lamp	FEM C201c-2	31S-LF7 (BK/BU)
RH front parking/turn signal lamp	FEM C201c-10	31S-LF16 (BK/RD)
LH rear combination lamp	REM C420e-6	31S-LF11 (BK/WH)
RH rear combination lamp	REM C420e-5	31S-LF20 (BK/OG)
NOTE: Both license lamps must be disconnected for correct test results. LH and RH license plate lamp	REM C420a-5	31S-LF12 (BK/GN)

- **Is any voltage present?**

Yes
REPAIR the control ground circuit as necessary. TEST the system for normal operation.

No
GO to U3 .

U3 CHECK THE CONTROL GROUND CIRCUIT FOR AN OPEN

- Connect: Inoperative Lamp(s).
- Connect a fused (5A) jumper wire between the FEM or REM and ground as follows:

Inoperative Lamp	Connector-Pin	Circuit
LH front side marker	FEM C201b-22	31S-LF8 (BK/OG)
RH front side marker	FEM C201b-11	31S-LF17 (BK/WH)
LH front parking/turn signal lamp	FEM C201c-2	31S-LF7 (BK/BU)
RH front parking/turn signal lamp	FEM C201c-10	31S-LF16 (BK/RD)

Yes
For the front parking or side marker lamp, GO to U5 .

For the rear parking lamp, GO to U6 .

No
For the front side marker, LEAVE the jumper wire connected. GO to U4 .

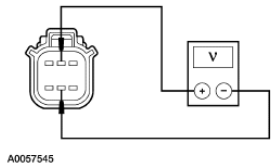
All others, REPAIR the control ground circuit as necessary. TEST the system for normal operation.

LH rear combination lamp	REM C420e-6	31S-LF11 (BK/WH)
RH rear combination lamp	REM C420e-5	31S-LF20 (BK/OG)
LH and RH license plate lamp	REM C420a-5	31S-LF12 (BK/GN)

- **Does the inoperative lamp now illuminate?**

U4 CHECK THE SIDE MARKER LAMP

- Disconnect: LH Headlamp C1021 or RH Headlamp C1041.
- Measure the voltage between the LH headlamp C1021-2, circuit 29S-LF8 (OG), harness side and the LH headlamp C1021-5, circuit 31S-LF8 (BK/OG), harness side; or between the RH headlamp C1041-2, circuit 29S-LF17 (OG/WH), harness side and the RH headlamp C1041-5, circuit 31S-LF17 (BK/WH), harness side



- **Is the voltage greater than 10 volts?**

Yes
INSTALL a new front side marker module. REFER to Headlamp Assembly in this section. TEST the system for normal operation.

No
REPAIR circuit 31S-LF8 (BK/OG) (LH side marker) or 31S-LF17 (BK/WH) (RH side marker) as necessary. TEST the system for normal operation.

U5 CHECK FOR FEM OPERATION

- Key in OFF position.
- Disconnect all FEM connectors.
- Check for:
  - corrosion
  - pushed-out pins
- Connect all FEM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new FEM. REFER to Section 418-00 . TEST the system for normal operation.

No
The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

U6 CHECK FOR REM OPERATION

- Key in OFF position.
- Disconnect all REM connectors.
- Check for:
  - corrosion
  - pushed-out pins
- Connect all REM connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new REM. REFER to Section 418-00 . TEST the system for normal operation.

No
The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

	REPEAT the self-test.

Pinpoint Test V: The Parking, Rear Or License Lamps Are On Continuously

Normal Operation

The instrument cluster monitors the headlamp switch position by sending out voltage reference signals to the headlamp switch. If a problem is detected with the circuits to the headlamp switch, the instrument cluster will default the headlamps and parking lamps on. When the headlamp switch is in the parking lamps ON position, the instrument cluster sends a signal to the front electronic module (FEM) and the rear electronic module (REM) to illuminate the parking lamps. Power is supplied to the LH front side marker and parking lamp through circuits 29S-LF3 (OG/YE), 29S-LF7 (OG/BU), 29S-LF8 (OG) and 29S-LF16 (OG/GN). Ground for the LH front side marker flows through circuit 31S-LF8 (BK/OG) to the FEM. Ground for the LH front parking lamp flows through circuit 31S-LF16 (BK/RD) and then through circuit 31S-LF7 (BK/BU) to the FEM. Power is supplied to the RH front side marker and parking lamp through circuits 29S-LF4 (OG/BU), 29S-LF17 (OG/WH) and 29S-LF16 (OG/GN). Ground for the RH front side marker flows through circuit 31S-LF17 (BK/WH) to the FEM. Ground for the RH front parking lamp flows through circuit 31S-LF16 (BK/RD) to the FEM. Power is supplied to the LH rear parking lamp through circuit 29S-LF23 (OG). Ground for the LH rear parking lamp flows through circuit 31S-LF11 (BK/WH) to the rear electronic module (REM). Power is supplied to the RH rear parking lamp through circuits 29S-LF24 (OG/BK), and 29S-LF23 (OG). Ground for the RH rear parking lamp flows through circuit 31S-LF11 (BK/WH) and then circuit 31S-LF20 (BK/OG) to the REM. Power is supplied to the license lamps through circuits 29S-LG2 (OG/BU), 29S-LF12 (OG/BK), 29S-LF21 (OG/BK) and 29S-LF22 (OG/BK). Ground for the license lamps flows through circuits 31S-LF21 (BK/GN) and 31S-LF22 (BK/GN) and then through circuit 31S-LF12 (BK/GN) to the REM. The FEM and REM control the ground circuits individually for the lamps (the license lamps share a common ground controlled circuit at the REM).

Possible Causes

- circuit 31S-LF8 (BK/OG) short to ground
- circuit 31S-LF16 (BK/RD) short to ground
- circuit 31S-LF7 (BK/BU) short to ground
- circuit 31S-LF17 (BK/WH) short to ground
- circuit 31S-LF11 (BK/WH) short to ground
- circuit 31S-LF20 (BK/OG) short to ground
- circuit 31S-LF21 (BK/GN) short to ground
- circuit 31S-LF22 (BK/GN) short to ground
- circuit 31S-LF12 (BK/GN) short to ground
- circuit 8-LF14 (WH/BU) short to ground
- headlamp switch
- instrument cluster
- FEM
- REM

PINPOINT TEST V: THE PARKING, REAR OR LICENSE LAMPS ARE ON CONTINUOUSLY

Test Step	Result / Action to Take
V1 CHECK THE EXTERIOR LAMPS	
• Observe the exterior parking lamps. • **Are all the parking lamps illuminated?**	**Yes** GO to V2 . **No** GO to V6 .

V2 CHECK THE HEADLAMP SWITCH INPUT	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Monitor the instrument cluster headlamp switch status PID while rotating the knob to the parking lamps ON and then OFF positions. • **Does the PID match with the headlamp switch position?**	**Yes** GO to V5 . **No** GO to V3 .
V3 CHECK THE HEADLAMP SWITCH	
• Key in OFF position. • Disconnect: Headlamp Switch C205. • Carry out the headlamp switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the headlamp switch OK?**	**Yes** GO to V4 . **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. TEST the system for normal operation.
V4 CHECK CIRCUIT 8-LF14 (WH/BU) FOR SHORT TO GROUND	
• Disconnect: Instrument Cluster C220c. • Measure the resistance between the headlamp switch C205-5, circuit 8-LF14 (WH/BU), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to V5 .
V5 CHECK FOR INSTRUMENT CLUSTER OPERATION	

• Key in OFF position.
• Disconnect all instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

V6 CHECK THE CONTROL GROUND CIRCUIT FOR SHORT TO GROUND	
• Key in OFF position. • Disconnect: REM C420a and C420e.	**Yes** REPAIR the control ground circuit as necessary. TEST the system for normal

• Disconnect: FEM C201b and C201c. • Key in ON position. • **Does the parking, rear or license lamps continue to illuminate?**	operation. **No** For the front lamp, GO to V7 . For the rear or license lamp, GO to V8 .
V7 CHECK FOR FEM OPERATION	

• Key in OFF position.
• Disconnect all FEM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all FEM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FEM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

V8 CHECK FOR REM OPERATION	

• Key in OFF position.
• Disconnect all REM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all REM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new REM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

Fog Lamps Printable View (100 KB)

Refer to Wiring Diagrams Cell 86 for schematic and connector information.

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052 or equivalent diagnostic tool with appropriate adapter cable

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Headlamp switch	• Underhood auxiliary junction box (AJB) fuse 3 (15A) • Fog lamp relay • Circuitry • Front electronic module (FEM) • Instrument cluster

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

4. If the cause is not visually evident, connect the diagnostic tool to the data link connector and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
   - check that the program card is correctly installed.
   - check the connections to the vehicle.
   - check the ignition switch position.

5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

6. Carry out the diagnostic tool data link test. If the diagnostic tool responds with:
   - SCP+, SCP-, ISO or UBP circuit fault; all electronic control units no response/not equipped, refer to Section 418-00 .
   - No response/not equipped for FEM, refer to Section 418-00 .
   - No response/not equipped for instrument cluster, refer to Section 418-00 .
   - System passed, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out self-test diagnostics for the FEM.

7. If the DTCs retrieved are related to the concern, go to Front Electronic Module (FEM) Diagnostic Trouble Code (DTC) Index or Instrument Cluster Diagnostic Trouble Code (DTC) Index.

8. If multiple symptoms exist, check the Switched System Power (SSP) Relay Index before proceeding to the next step. Refer to Headlamps in this section.

9. If no DTCs related to the concern are retrieved, GO to Symptom Chart to continue diagnostics.

NOTE: For a complete master list of DTCs, refer to Section 418-00 .

Front Electronic Module (FEM) Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1342	ECU Is Defective	FEM	CLEAR the DTCs. RETRIEVE the DTCs. If DTC B1342 is retrieved, INSTALL a new FEM. REFER to Section 418-00 .

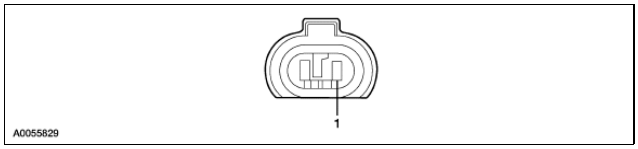
Instrument Cluster Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1342	ECU Is Defective	Instrument cluster	CLEAR and DOCUMENT the DTCs. CARRY OUT the instrument cluster Self-Test. INSTALL a new instrument cluster if DTC B1342 is retrieved again. REFER to Section 413-00 .
B2472	Fog Lamp Switch Failure	Instrument cluster	Go To Pinpoint Test X .

Symptom Chart

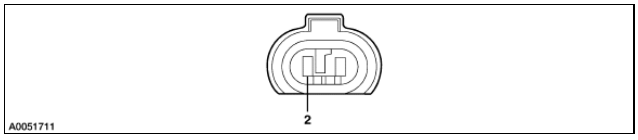
Symptom Chart
Connector Circuit Reference

LH Fog Lamp C152



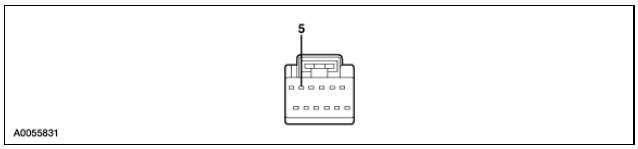
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	31-LD11 (BK/WH) fog lamp ground circuit	0 voltage, less than 5 ohms between the fog lamp and ground.

RH Fog Lamp C162



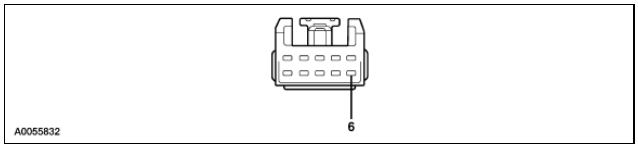
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
2	31-LD17 (BK/WH) fog lamp ground circuit	0 voltage, less than 5 ohms between the fog lamp and ground.

FEM C201c



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
5	31S-LD9 (BK/GN) fog lamp relay control ground circuit	Greater than 10 volts with the ignition switch in any position, less than 5 ohms between the FEM and the fog lamp relay.

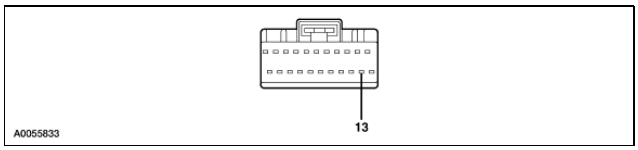
Headlamp Switch C205



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
6	8-LD10 (WH/BK) fog lamp switch input circuit	Less than 5 ohms between the headlamp switch and the instrument cluster. Greater than 10,000 ohms between the

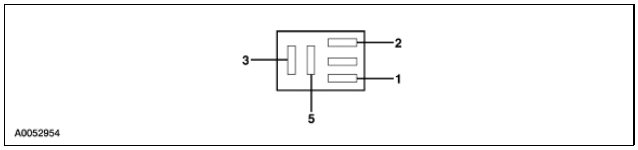
		headlamp switch and ground.

Instrument Cluster C220c



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
13	8-LD10 (WH/BK) fog lamp switch input circuit	0 voltage, less than 5 ohms between the instrument cluster and the headlamp switch. Greater than 10,000 ohms between the instrument cluster and ground.

Fog Lamp Relay C1007



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	30S-LD8B (RD) B+ power supply circuit	Greater than 10 volts with the ignition switch in any position.
2	31S-LD9 (BK/GN) fog lamp relay control ground circuit	0 voltage, less than 5 ohms between the fog lamp relay and the FEM. Greater than 10,000 ohms between the fog lamp relay and ground.
3	30S-LD8A (RD) B+ power supply circuit	Greater than 10 volts with the ignition switch in any position.
5	30S-LD2 (RD/BU) fog lamps switched power supply circuit	0 voltage, less than 5 ohms between the fog lamp relay and the fog lamps.

Pinpoint Test W: The Fog Lamps Are Inoperative

Normal Operation

The instrument cluster sends a voltage signal to the headlamp switch through circuit 8-LD10 (WH/BK). When the fog lamp switch is engaged, the signal is allowed to return to the instrument cluster. When the instrument cluster detects that the fog lamp switch is engaged, a signal is sent to the front electronic module (FEM) via the SCP network to command the fog lamps on. The fog lamp relay receives power from circuits 30S-LD8A (RD) and 30S-LD8B (RD). The fog lamp relay coil is grounded through circuit 31S-LD9 (BK/GN) to the FEM. When the FEM grounds circuit 31S-LD9 (BK/GN), the fog lamp relay is energized, switching power to circuit 30S-LD2 (RD/BU). Voltage then flows through circuits 30S-LD11 (RD/WH) and 30S-LD17 (RD/WH) to the LH and RH fog lamps, respectively. Ground for the LH fog lamp is through circuit 31-LD11 (BK/WH). Ground for the RH fog lamp is through circuit 31-LD17 (BK/WH).

Possible Causes

- circuit 8-LD10 (WH/BK) open
- circuit 31S-LD9 (BK/GN) open or short to power
- circuit 30S-LD8A (RD) open
- circuit 30S-LD8B (RD) open
- circuit 30S-LD2 (RD/BU) open
- fog lamp relay
- headlamp switch
- instrument cluster
- FEM

PINPOINT TEST W: THE FOG LAMPS ARE INOPERATIVE

Test Step	Result / Action to Take
W1 CHECK THE HEADLAMP SWITCH OUTPUT	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Monitor the instrument cluster fog lamp switch status PID while rotating the knob to the parking lamps ON position and then engaging the fog lamp switch. • **Does the PID match with the headlamp switch position?**	**Yes** GO to W5 . **No** GO to W2 .
W2 CHECK THE HEADLAMP SWITCH	
• Key in OFF position. • Disconnect: Headlamp Switch C205. • Carry out the headlamp switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the headlamp switch OK?**	**Yes** GO to W3 . **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. TEST the system for normal operation.
W3 CHECK CIRCUIT 8-LD10 (WH/BK) FOR AN OPEN	
• Disconnect: Instrument Cluster C220c. • Measure the resistance between the instrument cluster C220c-13, circuit 8-LD10 (WH/BK), harness side and the headlamp switch C205-6, circuit 8-LD10 (WH/BK), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to W4 . **No** REPAIR the circuit. TEST the system for normal operation.
W4 CHECK FOR INSTRUMENT CLUSTER OPERATION	

• Key in OFF position.
• Disconnect all instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

W5 CHECK THE FOG LAMP RELAY	
• Key in OFF position. • Disconnect: Fog Lamp Relay C1007. • Carry out the fog lamp relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the fog lamp relay OK?**	**Yes** GO to W6 . **No** INSTALL a new fog lamp relay. TEST the system for normal operation.
W6 CHECK CIRCUITS 30S-LD8A (RD) AND 30S-LD8B (RD) FOR AN OPEN	
• Measure the voltage between the fog lamp relay C1007-3, circuit 30S-LD8A (RD), harness side and ground; and between the fog lamp relay C1007-1, circuit 30S-LD8B (RD), harness side and ground.  A0057549 • **Are the voltages greater than 10 volts?**	**Yes** GO to W7 . **No** REPAIR the circuit in question. TEST the system for normal operation.
W7 CHECK CIRCUIT 30S-LD2 (RD/BU) FOR AN OPEN	
• Connect a fused (15A) jumper wire between the fog lamp relay C1007-3, circuit 30S-LD8A (RD), harness side and the fog lamp relay C1007-5, circuit 30S-LD2 (RD/BU), harness side.  A0057550 • **Do the fog lamps illuminate?**	**Yes** REMOVE the jumper wire. GO to W8 . **No** REPAIR the circuit. TEST the system for normal operation.
W8 CHECK CIRCUIT 31S-LD9 (BK/GN) FOR SHORT TO POWER	

• Disconnect: FEM C201c. • Key in ON position. • Measure the voltage between the fog lamp relay C1007-2, circuit 31S-LD9 (BK/GN), harness side and ground.  GN1460-A • **Is any voltage present?**	**Yes** GO to W9 . **No** REPAIR the circuit. TEST the system for normal operation.
W9 CHECK CIRCUIT 31S-LD9 (BK/GN) FOR AN OPEN	
• Key in OFF position. • Connect: Fog Lamp Relay C1007. • Connect a fused (10A) jumper wire between the FEM C201c-5, circuit 31S-LD9 (BK/GN), harness side and ground.  A0057551 • **Do the fog lamps illuminate?**	**Yes** GO to W10 . **No** REPAIR the circuit. TEST the system for normal operation.
W10 CHECK FOR FEM OPERATION	

• Key in OFF position.
• Disconnect all FEM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all FEM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FEM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

Pinpoint Test X: The Fog Lamps Are On Continuously

Normal Operation

The instrument cluster sends a voltage signal to the headlamp switch through circuit 8-LD10 (WH/BK). When the fog lamp switch is engaged, the signal is allowed to return to the instrument cluster. When the instrument cluster detects that the fog lamp switch is engaged, a signal is sent to the front electronic module (FEM) via the SCP network to command the fog lamps on. The fog lamp relay receives power from circuits 30-LD8A (RD) and 30-LD8B (RD). The fog lamp relay coil is ground through circuit 31S-LD9 (BK/GN) to the FEM. When the FEM grounds circuit 31S-LD9 (BK/GN), the fog lamp relay is energized, switching power to circuit 30S-LD2 (RD/BU). Voltage then flows through circuits 30S-LD11 (RD/WH) and 30S-LD17 (RD/WH) to the LH and RH fog lamps, respectively.

Possible Causes

- circuit 8-LD10 (WH/BK) short to ground
- circuit 31S-LD9 (BK/GN) short to ground
- circuit 30S-LD11 (RD/WH) short to power
- circuit 30S-LD17 (RD/WH) short to power
- circuit 30S-LD2 (RD/BU) short to power
- fog lamp relay
- headlamp switch
- instrument cluster
- FEM

PINPOINT TEST X: THE FOG LAMPS ARE ON CONTINUOUSLY

Test Step	Result / Action to Take
X1 CHECK THE HEADLAMP SWITCH OUTPUT	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Monitor the instrument cluster fog lamp switch status PID while rotating the knob to the parking lamps ON position and then engaging the fog lamp switch. • **Does the PID match with the headlamp switch position?**	**Yes** GO to X5 . **No** GO to X2 .
X2 CHECK THE HEADLAMP SWITCH	
• Key in OFF position. • Disconnect: Headlamp Switch C205. • Carry out the headlamp switch component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the headlamp switch OK?**	**Yes** GO to X3 . **No** INSTALL a new headlamp switch. REFER to Headlamp Switch in this section. TEST the system for normal operation.
X3 CHECK CIRCUIT 8-LD10 (WH/BK) FOR SHORT TO GROUND	
• Disconnect: Instrument Cluster C220c. • Measure the resistance between the instrument cluster C220c-13, circuit 8-LD10 (WH/BK), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to X4 .
X4 CHECK FOR INSTRUMENT CLUSTER OPERATION	

• Key in OFF position.
• Disconnect all instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

X5 CHECK THE FEM	
• Key in OFF position. • Disconnect: FEM C201c. • Key in ON position. • **Do the fog lamps continue to illuminate?**	**Yes** GO to X7 . **No** GO to X6 .
X6 CHECK FOR FEM OPERATION	

• Key in OFF position.
• Disconnect all FEM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all FEM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FEM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

X7 CHECK CIRCUIT 30S-LD2 (RD/BU), 30S-LD11 (RD/WH) AND 30S-LD17 (RD/WH) FOR SHORT TO POWER	
• Disconnect: Fog Lamp Relay C1007. • **Do the fog lamps continue to illuminate?**	**Yes** REPAIR the circuit as necessary. TEST the system for normal operation. **No** GO to X8 .
X8 CHECK THE FOG LAMP RELAY	
• Carry out the fog lamp relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the fog lamp relay OK?**	**Yes** REPAIR circuit 31S-LD9 (BK/GN). TEST the system for normal operation. **No** INSTALL a new fog lamp relay. TEST the system for normal operation.

Reversing Lamps Printable View (68 KB)

Refer to Wiring Diagrams Cell 93 for schematic and connector information.

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052 or equivalent diagnostic tool with appropriate adapter cable

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Digital transmission range (TR) sensor	• Battery junction box (BJB) fuse 6 (10A) (reversing lamps) • Circuitry • Bulbs • Rear electronic module (REM)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

NOTE: Make sure the headlamp switch is in the OFF position.

4. If the cause is not visually evident, connect the diagnostic tool to the data link connector and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
   - check that the program card is correctly installed.
   - check the connections to the vehicle.
   - check the ignition switch position.

5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

6. Carry out the diagnostic tool data link test. If the diagnostic tool responds with:
   - SCP+, SCP-, ISO or UBP circuit fault; all electronic control units no response/not equipped, refer to Section 418-00 .
   - No response/not equipped for REM, refer to Section 418-00 .
   - System passed, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out self-test diagnostics for the REM.

7. If the DTCs retrieved are related to the concern, go to Rear Electronic Module (REM) Diagnostic Trouble Code (DTC) Index.

8. If multiple symptoms exist, check the Switched System Power (SSP) Relay Index before proceeding to the next step. Refer to Headlamps in this section.

9. If no DTCs related to the concern are retrieved, GO to Symptom Chart to continue diagnostics.

NOTE: For a complete master list of DTCs, refer to Section 418-00 .

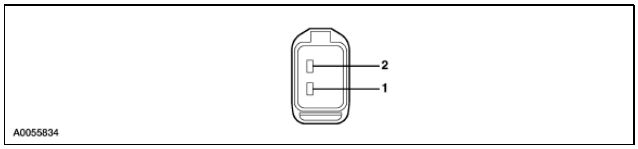
Rear Electronic Module (REM) Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1342	ECU Is Defective	REM	CLEAR and DOCUMENT the DTCs. CARRY OUT the instrument cluster self-test. INSTALL a new REM if DTC B1342 is retrieved again. REFER to Section 418-00 .

Symptom Chart

Symptom Chart
Connector Circuit Reference

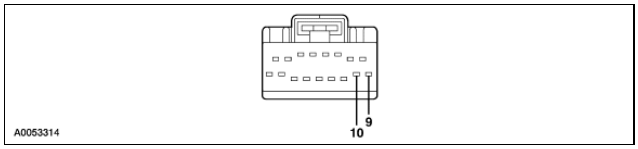
LH Reversing Lamp C451, RH Reversing Lamp C461



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1 (C451)	31S-LG9 (BK/GN) reversing lamp control ground circuit	0 voltage, less than 5 ohms between the reversing lamp and the REM. Greater than 10,000 ohms between the reversing lamp and ground.
2 (C451)	29S-LG9 (OG/BK) reversing lamp power supply circuit	Greater than 10 volts with the ignition ON.

1 (C461)	31S-LG16 (BK/RD) reversing lamp control ground circuit	0 voltage, less than 5 ohms between the reversing lamp and the REM. Greater than 10,000 ohms between the reversing lamp and ground.
2 (C461)	29S-LG16 (OG/GN) reversing lamp power supply circuit	Greater than 10 volts with the ignition ON.

REM C420e



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
9	31S-LG9 (BK/GN) LH reversing lamp control ground circuit	Greater than 10 volts with the ignition ON. Greater than 10,000 ohms between the REM and ground.
10	31S-LG16 (BK/RD) RH reversing lamp control ground circuit	Greater than 10 volts with the ignition ON. Greater than 10,000 ohms between the REM and ground.

Pinpoint Test Y: The Reversing Lamps Are Inoperative

Normal Operation

The powertrain control module (PCM) monitors the digital transmission range (TR) sensor. When the PCM detects the transmission in REVERSE, a signal is sent to the rear electronic module (REM) to illuminate the reversing lamps. Power from the battery junction box (BJB) is sent through circuit 29S-LG1 (OG/YE) to circuits 29S-LG9 (OG/BK) and 29S-LG16 (OG/GN) to the LH and RH reversing lamps respectively. Ground for the LH reversing lamp is sent through circuit 31S-LG9 (BK/GN) to the REM. Ground for the RH reversing lamp is sent through circuit 31S-LG16 (BK/RD) to the REM. The REM individually controls the ground circuits for the reversing lamps.

Possible Causes

- REM
- PCM

PINPOINT TEST Y: THE REVERSING LAMPS ARE INOPERATIVE

Test Step	Result / Action to Take
Y1 CHECK THE VOLTAGE SUPPLY TO THE REVERSING LAMPS	
• Key in ON position. • Place the multifunction switch in the LH turn position and observe the LH rear turn signal. • **Does the LR turn signal operate correctly?**	**Yes** GO to Y2 . **No** REFER to Turn Signal and Hazard Lamps to continue diagnostics.

Y2 CHECK THE PCM	
• Key in OFF position. • Connect the diagnostic tool. • Key in ON position. • Engage the parking brake. • Monitor the PCM transmission gear status PID while placing the transmission in reverse and then neutral. • **Does the PID match with the transmission gear selected?**	**Yes** GO to Y4 . **No** GO to Y3 .
Y3 CHECK FOR PCM OPERATION	

• Key in OFF position.
• Disconnect all PCM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-04A or Section 303-04B . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

Y4 CHECK FOR REAR ELECTRONIC MODULE (REM) OPERATION	

• Key in OFF position.
• Disconnect all REM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all REM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new REM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

Pinpoint Test Z: The Individual Reversing Lamp Is Inoperative

Normal Operation

When the powertrain control module (PCM) detects the transmission in REVERSE, a signal is sent to the rear electronic module (REM) to illuminate the reversing lamps. Power from the battery junction box (BJB) is sent through circuit 29S-LG1 (OG/YE) to circuits 29S-LG9 (OG/BK) and 29S-LG16 (OG/GN) to the LH and RH reversing lamps, respectively. Ground for the LH reversing lamp is sent through circuit 31S-LG9 (BK/GN) to the REM. Ground for the RH reversing lamp is sent through circuit 31S-LG16 (BK/RD) to the REM. The REM individually controls the ground circuits for the reversing lamps.

Possible Causes

- circuit 29S-LG9 (OG/BK) open
- circuit 29S-LG16 (OG/GN) open
- circuit 31S-LG9 (BK/GN) open or short to power
- circuit 31S-LG16 (BK/RD) open or short to power

- REM.

PINPOINT TEST Z: THE INDIVIDUAL REVERSING LAMP IS INOPERATIVE

Test Step	Result / Action to Take
Z1 CHECK THE CIRCUIT 29S-LG9 (OG/BK) OR 29S-LG16 (OG/GN) FOR AN OPEN	
• Key in OFF position. • Disconnect: Inoperative Reversing Lamp. • Key in ON position. • Measure the voltage between the LH reversing lamp C451-2, circuit 29S-LG9 (OG/BK), harness side and ground; or between the RH reversing lamp C461-2, circuit 29S-LG16 (OG/GN), harness side and ground.  A0057553 • **Is the voltage greater than 10 volts?**	**Yes** GO to Z2 . **No** REPAIR the circuit in question. TEST the system for normal operation.
Z2 CHECK THE CIRCUIT 31S-LG9 (BK/GN) OR 31S-LG16 (BK/RD) FOR SHORT TO POWER	
• Key in OFF position. • Disconnect: REM C420e. • Key in ON position. • Measure the voltage between the LH reversing lamp C451-1, circuit 31S-LG9 (BK/GN), harness side and ground; or between the RH reversing lamp C461-1, circuit 31S-LG16 (BK/RD), harness side and ground.  A0057554 • **Is any voltage present?**	**Yes** REPAIR the circuit in question. TEST the system for normal operation. **No** GO to Z3 .
Z3 CHECK THE CIRCUIT 31S-LG9 (BK/GN) OR 31S-LG16 (BK/RD) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the LH reversing lamp C451-1, circuit 31S-LG9 (BK/GN), harness side and the REM C420e-9, circuit 31S-LG9 (BK/GN), harness side; or between the RH reversing lamp C461-1, circuit 31S-LG16 (BK/RD), harness side and the REM C420e-10, circuit 31S-LG16 (BK/RD), harness side.	**Yes** GO to Z4 . **No** REPAIR the circuit in question. TEST the system for normal operation.

 • **Is the resistance less than 5 ohms?**	
Z4 CHECK FOR REM OPERATION	

• Key in OFF position.
• Disconnect all REM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all REM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new REM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

Pinpoint Test AA: The Reversing Lamp Are On Continuously

Normal Operation

The powertrain control module (PCM) monitors the digital transmission range (TR) sensor. When the PCM detects the transmission in REVERSE, a signal is sent to the rear electronic module (REM) to illuminate the reversing lamps. Ground for the LH reversing lamp is sent through circuit 31S-LG9 (BK/GN) to the REM. Ground for the RH reversing lamp is sent through circuit 31S-LG16 (BK/RD) to the REM. The REM individually controls the ground circuits for the reversing lamps.

Possible Causes

- circuit 31S-LG9 (BK/GN) short to ground
- circuit 31S-LG16 (BK/RD) short to ground
- REM
- PCM

PINPOINT TEST AA: THE REVERSING LAMPS ARE ON CONTINUOUSLY

Test Step	Result / Action to Take
AA1 CHECK THE REVERSING LAMPS	
• Key in ON position. • Observe the reversing lamps. • **Are both reversing lamps illuminated?**	**Yes** GO to AA2 . **No** GO to AA4 .
AA2 CHECK THE PCM	

• Key in OFF position. • Disconnect: PCM C175a. • Key in ON position. • **Do the reversing lamps continue to illuminate?**	**Yes** GO to AA5 . **No** GO to AA3 .
AA3 CHECK FOR PCM OPERATION	

• Key in OFF position.
• Disconnect all PCM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-04A or Section 303-04B . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

AA4 CHECK THE REM	
• Key in OFF position. • Disconnect: REM C420e. • Key in ON position. • **Does the reversing lamp continue to illuminate?**	**Yes** REPAIR circuit 31S-LG9 (BK/GN) (LH reversing lamp) or 31S-LG16 (BK/RD) (RH reversing lamp) as necessary. TEST the system for normal operation. **No** GO to AA5 .
AA5 CHECK FOR REM OPERATION	

• Key in OFF position.
• Disconnect all REM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all REM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new REM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. REPEAT the self-test.

Daytime Running Lamps Printable View (10 KB)

Refer to Wiring Diagrams Cell 87 for schematic and connector information.

Inspection and Verification

NOTE: When installing a new front electronic module (FEM), it must be reconfigured for this feature. Refer to Section 418-00

1. Verify the customer concern by operating the daytime running lamps (DRL) following these steps:
    1. Place the ignition switch in the RUN position.
    2. Place the headlamp switch in the OFF position.
    3. If the DRL does not operate, make sure the FEM is configured for DRL before proceeding to the next step.

2. Verify the parking lamp operation.
    1. Place the headlamp switch in the parking lamps ON position.
    If the parking lamps do not operate correctly, REFER to Parking, Rear and License Lamps in this section.

3. Verify the high beam operation.
    1. Place the headlamp switch in the headlamps ON position.
    2. Place the multifunction switch in the high beam position.
    If the high beams operate correctly and the DRL operation is incorrect, INSTALL a new FEM. REFER to Section 418-00 . TEST the system for normal operation.
    If the high beams do not operate correctly, REFER to Headlamps in this section for correct diagnosis.

Headlamp Adjustment

Printable View (46 KB)

Headlamp Aiming

1. The headlamp aiming procedure depends on the type of beam pattern the headlamp is equipped with. Vehicles may come equipped with visual optical right (VOR), visual optical left (VOL), or SAE only (includes sealed beam type) headlamps. To identify the headlamp beam pattern, look on the headlamp lens. Molded in small letters on the headlamp lens is one of the following:
    - SAE
    - VOR or SAE
    - VOL or SAE

2. Once the headlamp beam pattern is identified, aim the headlamps using one of the following methods as applicable.
    - Photometric aimers can aim SAE, VOR and VOL type headlamps. This is the preferred method of headlamp aiming.
    - Visual or screen method aiming can be used to aim SAE, VOR and VOL type headlamps.
    - Mechanical aimers can be used only with SAE type headlamps. Lamps that can be aimed mechanically will have three nibs molded into the lens of the lamp.

Photometric Aiming

1. For the photometric aiming procedure, refer to the appropriate photometric headlamp aimer instruction manual.

Screen Method Aiming

All headlamp types

NOTE: Horizontal aim is not necessary for VOR or VOL headlamps.

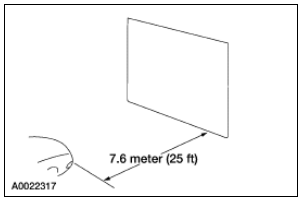
NOTE: Consult your state vehicle inspection manual for recommended tolerance ranges for visual aiming.

NOTE: The sight shield may need to be positioned or removed for access to the adjusters.

1. Before starting headlamp adjustment:
    - Check the tire inflation.
    - Check that no other load is in the vehicle other than a half tank of fuel.
    - Check that the headlamps are clean.
    - Check for correct headlamp operation.
    - Check that the vehicle is on level ground.
    - If the vehicle is equipped with air suspension, make sure that the switch is on.

2. **NOTE:** The vertical wall or screen must be a minimum of 2.4 meters (8 feet) wide.

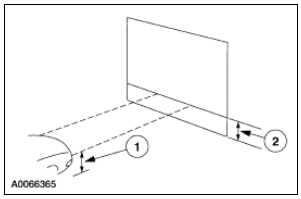
   Park the vehicle on a level surface approximately 7.6 meters (25 feet) from the vertical wall or screen directly in front of it.



3. **NOTE:** The center of the lamp is marked by a 3 mm (0.12 in) circle on the headlamp lens.

   Mark a horizontal reference line on the vertical wall or screen.

   1. Measure the center of the headlamp height to ground and record.
   2. Make a 2.4 meter (8 foot) horizontal mark (masking tape) on the vertical wall or screen at the same distance from the ground as previously recorded.



4. **NOTE:** This procedure should be done in a dark environment to effectively see the headlamp beam pattern.

   Turn on the low beam headlamps to illuminate the wall or screen and open the hood.

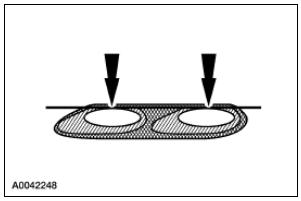
5. **NOTE:** For SAE type headlamps, the appearance of the beam pattern may vary between vehicles.

   On the wall or screen, locate the high intensity area of the beam pattern. Place the top edge of the high intensity zone even with the horizontal reference line.

VOR type headlamps

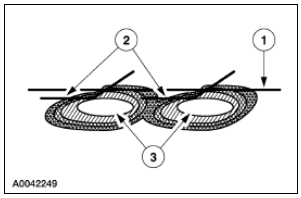
6. **NOTE:** The appearance of the VOR beam pattern may vary between vehicles.

   Identify at the top edge of this high intensity area a distinct horizontal cutoff in the beam pattern. If the top edge of this cutoff is not even with the horizontal reference line, the headlamp beam will need to be adjusted.



VOL type headlamps

7. For VOL type headlamps, there will be a distinct cutoff in the left portion of the beam pattern. The edge of this cutoff should be positioned 50.2 mm (2 in) below the horizontal reference line.
   1. Horizontal reference line.
   2. Top edge of the beam pattern.
   3. High intensity zone.



Mechanical Aiming

1. For the mechanical aiming procedure, refer to the appropriate mechanical headlamp aimer instruction manual.

Headlamp Assembly

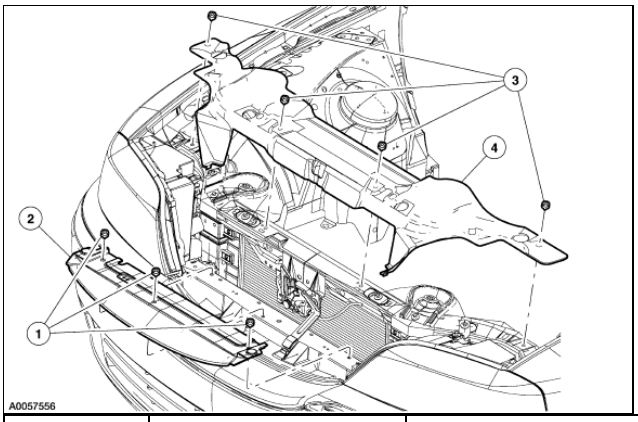
Printable View (602 KB)

NOTE: Make sure the headlamp switch and ignition switch are in the OFF position.

1. To remove individual components, only carry out the following steps.

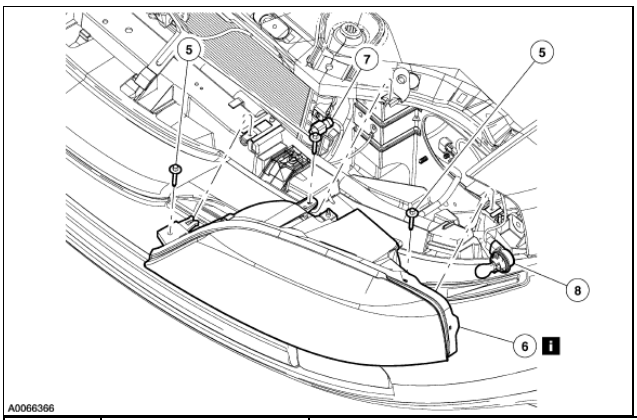
Component	Steps
Radiator grille opening cover	1-2
Radiator sight shield	1-4
Headlamp assembly	1-8

2. View 1 of 2. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1		Pin type retainers
2	8C300	Radiator grille opening cover
3		Pin type retainers
4	8C291	Radiator sight shield

3. View 2 of 2. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
5	N606679-S	Headlamp bolts
6	13008	

		Standard headlamp Disassembly Note
6	13008	High intensity discharge (HID) headlamp Disassembly Note
7	14290	Electrical connector
8	13411	Parking/turn lamp

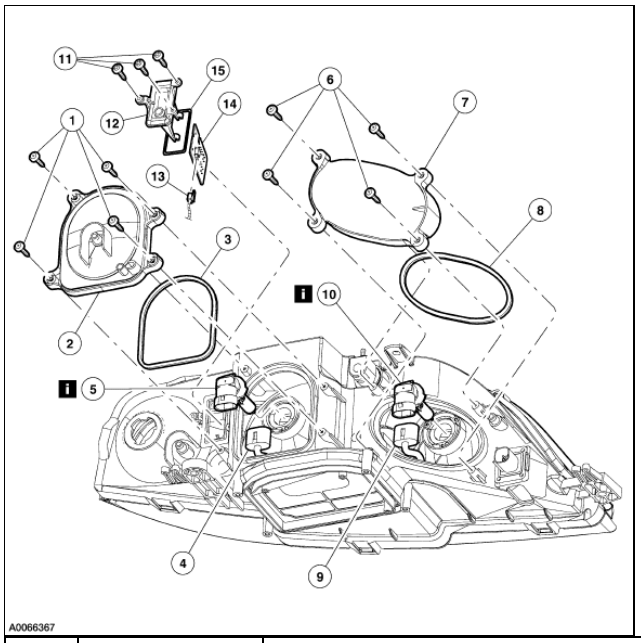
4. To install, reverse the removal procedure.

Item 6: Standard Headlamp Disassembly Note

1. To remove individual components, only carry out the following steps.

Component	Steps
Low beam bulb	1-2, 4-5
High beam bulb	6-7, 9-10
Side marker module	11-14

2. Disassemble the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1	13378	Low beam access cover screws (four required)
2	13071	Low beam access cover
3	13022	Low beam access cover seal
4		Electrical connector (part of 13008)
5	13N021	Low beam bulb Removal Note
6	13378	High beam access cover screws (four required)
7	13071	High beam access cover
8	13022	High beam access cover seal
9		Electrical connector (part of 13008)

10	13N021	High beam bulb Removal Note
11		Side marker module screw (part of 13008)
12		Side marker module bracket (part of 13008)
13		Electrical connector (part of 13008)
14		Side marker module (part of 13008)
15		Side marker module seal (part of 13008)

3. To assemble, reverse the disassembly procedure.

Items 5 and 10: Low and High Beam Bulb Removal Note

⚠ WARNING: The headlamp bulb contains gas under pressure. The bulb may shatter if the glass envelope is scratched or if the bulb is dropped. Handle the bulb only by its base. Avoid touching the glass envelope. Failure to follow these instructions may result in personal injury.

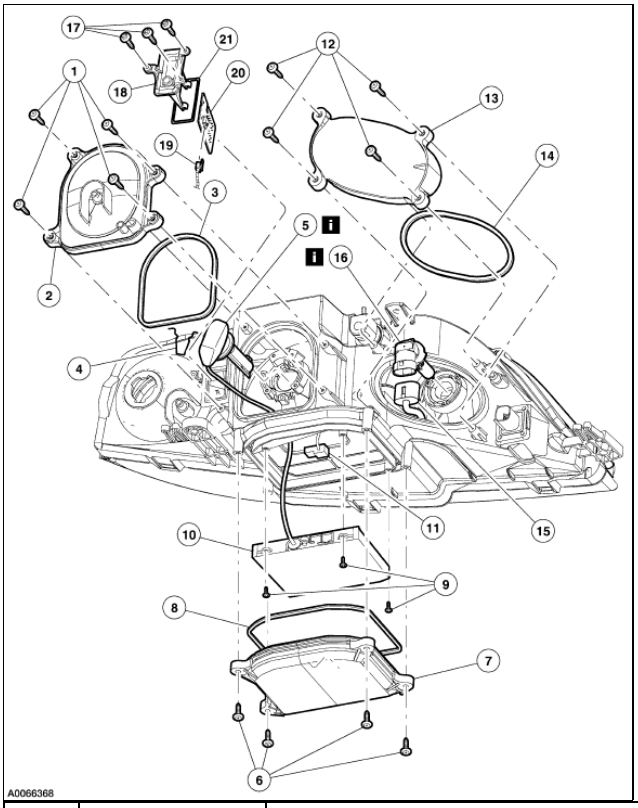
1. The headlamp bulb should not be removed from the headlamp until just before a new bulb is installed. Removing the bulb for an extended period of time may affect headlamp bulb performance. Contaminants may enter the headlamp with the bulb removed from the leadlamp.

Item 6: HID Headlamp Disassembly Note

1. To remove individual components, only carry out the following steps.

Component	Steps
HID ballast and bulb	1-2, 4-7, 9-11
High beam bulb	12-13, 15-16
Side marker module	17-20

2. Disassemble the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1	13378	Low beam access cover screws (four required)
2	13071	Low beam access cover
3	13022	Low beam access cover seal
4		HID lamp retainer (part of 13008)
5	13D109	HID low beam bulb Removal Note
6	13378	Ballast access cover screws (four required)
7	13180	Ballast access cover
8	13160	Ballast access cover seal
9		Ballast screws (three required)
10	13C170	Ballast and bulb assembly
11		Electrical connector (part of 13008)
12	13378	Screws (four required)
13	13071	High beam access cover
14	13160	High beam access cover seal
15		Electrical connector (part of 13008)
16	13N021	High beam bulb Removal Note
17		Side marker module screw (part of 13008)
18		Side marker module bracket (part of 13008)
19		Electrical connector (part of (13008)
20		Side marker module (part of 13008)
21		Side marker module seal (part of 13008)

3. To assemble, reverse the disassembly procedure.

Items 5, and 16: Low and High Beam Bulb Removal Note

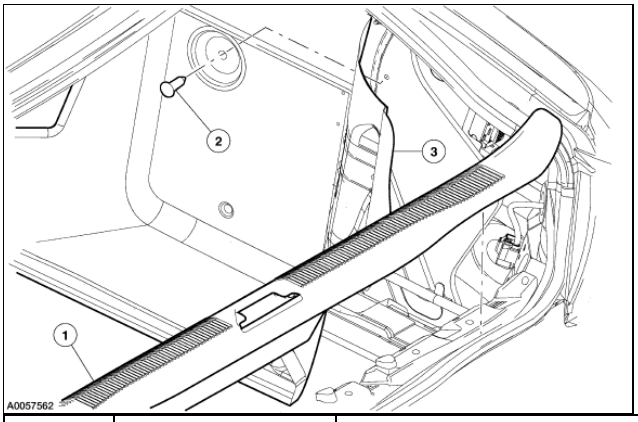
⚠ WARNING: The headlamp bulb contains gas under pressure. The bulb may shatter if the glass envelope is scratched or if the bulb is dropped. Handle the bulb only by its base. Avoid touching the glass envelope. Failure to follow these instructions may result in personal injury.

1. The headlamp bulb should not be removed from the headlamp until just before a new bulb is installed. Removing the bulb for an extended period of time may affect headlamp bulb performance. Contaminants may enter the headlamp where they can settle on the lens and reflector. Never turn on the headlamp with the bulb removed from the headlamp.

Rear Lamp Assembly

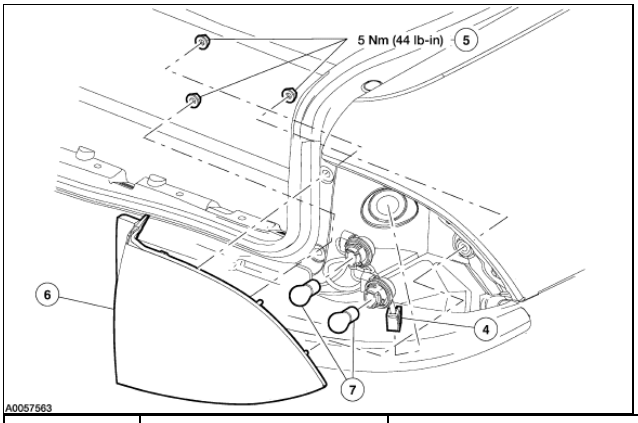
Printable View (190 KB)

1. View 1 of 2. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1	54406A64	Luggage compartment scuff plate
2		Pin type retainer
3	5445422	Luggage compartment side trim panel

2. View 2 of 2. Remove the components in the order indicated in the following illustration and table.



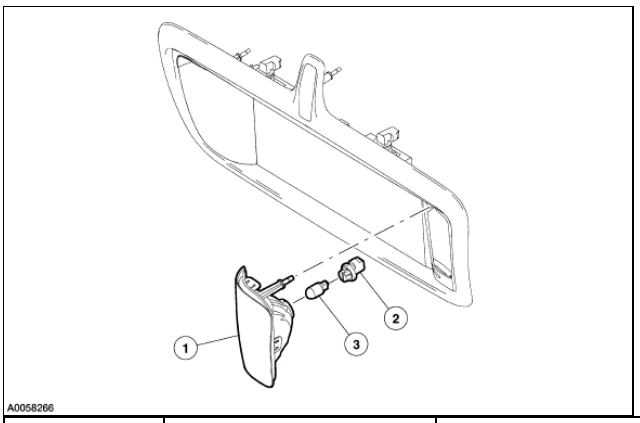
Item	Part Number	Description
4	13A409	Electrical connector
5	N621925-S	Rear lamp nuts (three required)
6	13B504	Rear lamp assembly
7	13465	Rear lamp bulbs

3. To install, reverse the removal procedure.

Reversing Lamp Assembly

Printable View (41 KB)

1. Remove the license plate housing. For additional information, refer to Section 501-00 .
2. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1	15500	Reversing lamp assembly
2	13411	Reversing lamp holder
3	13465	Reversing lamp bulb

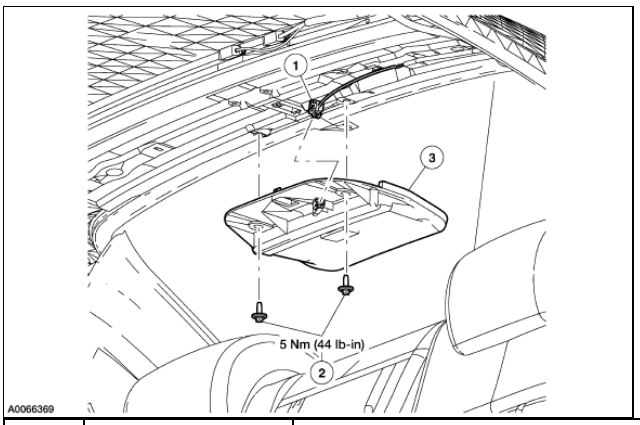
3. To install, reverse the removal procedure.

High Mounted Stoplamp

Printable View (90 KB)

1. Remove the headliner. For additional information, refer to Section 501-01 .

2. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1	14A005	Electrical connector
2	W706681-S900	High mounted stoplamp screws (2 required)
3	13A613	High mounted stoplamp

3. To install, reverse the removal procedure.

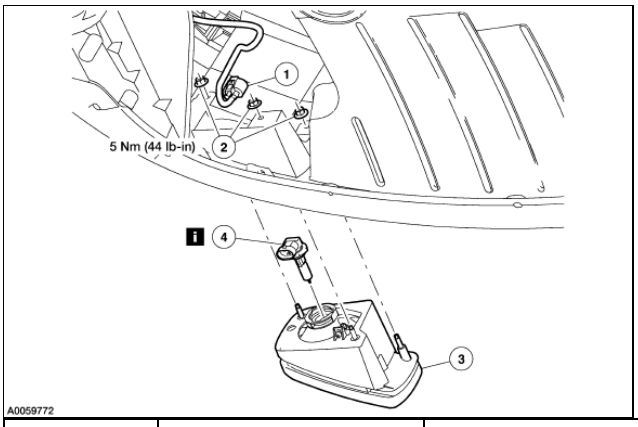
Fog Lamp Printable View (69 KB)

NOTE: Make sure the headlamp switch and ignition switch are in the OFF position.

1. Raise and support the vehicle. For additional information, refer to Section 100-00 .
2. To remove individual components, only carry out the following steps.

Component	Steps
Fog lamp bulb	1, 4
Fog lamp housing	1-3

3. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1	14290	Electrical connector
2	N621906-S	Fog lamp nuts (3 required)
3	15A255	Fog lamp assembly
4	13465	Fog lamp bulb Removal Note

4. To install, reverse the removal procedure.

Item 4: Fog Lamp Bulb Removal Note

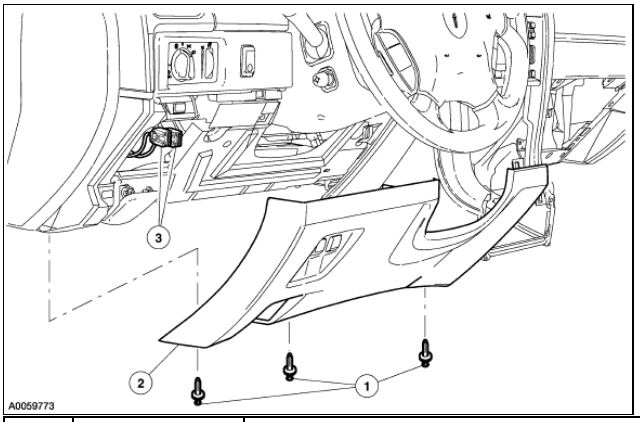
⚠ WARNING: The halogen bulb contains gas under pressure. The bulb may shatter if the glass envelope is scratched or if the bulb is dropped. Handle the bulb only by its base. Avoid touching the glass envelope. Failure to follow these instructions may result in personal injury.

1. The fog lamp bulb should not be removed from the fog lamp until just before a new bulb is installed. Removing the bulb for an extended period of time may affect fog lamp performance. Contaminants may enter the fog lamp where they can settle on the lens and reflector. Never turn on the fog lamps with the bulb removed.

Headlamp Switch

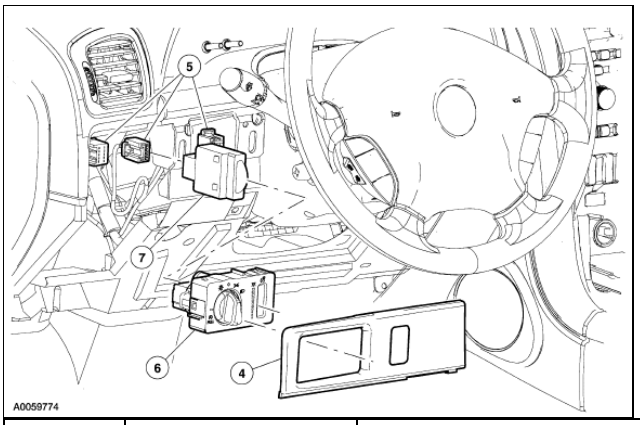
Printable View (214 KB)

1. View 1 of 2. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1		Instrument panel steering column cover pin-type retainers
2	04459	Instrument panel steering column cover
3	14401	Electrical connectors

2. View 2 of 2. Remove the components in the order indicated in the following illustration and table.



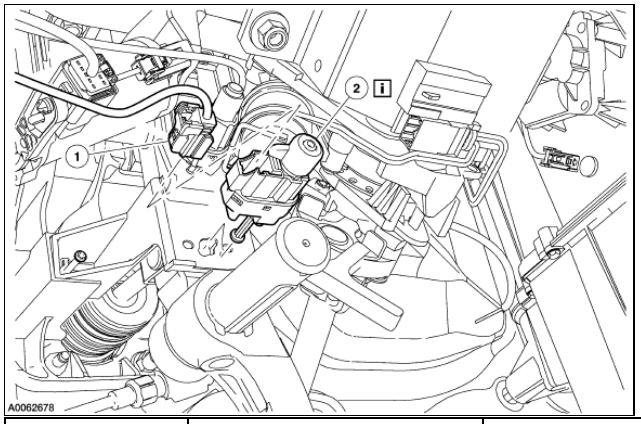
Item	Part Number	Description
4	54044B89	Outer instrument panel finish panel
5	14401	Electrical connectors
6	13K196	Headlamp switch
7	13K196	Dimmer switch

3. To install, reverse the removal procedure.

Brake Pedal Position (BPP) Switch

Printable View (175 KB)

1. Remove the components in the order indicated in the following illustration and table.



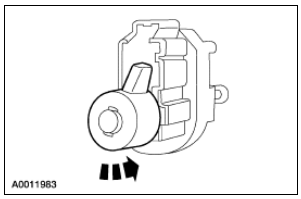
Item	Part Number	Description
1	14A005	Electrical connector
2	13480	BPP switch Installation Note

2. To install, reverse the removal procedure.

Item 2: BPP Switch Installation Note

⚠ CAUTION: Initial installation of the brake pedal position (BPP) switch allows for one adjustment. If additional adjustments are required, install a new BPP switch.

1. Rotate the knob counterclockwise to the stop to unlock.



2. With the engine running, fully depress the brake pedal.

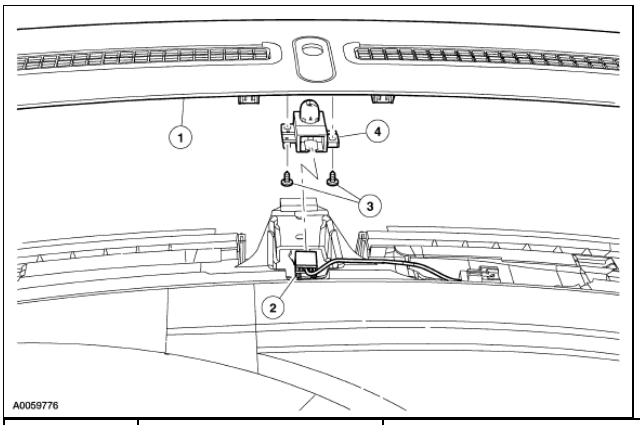
3. Install the BPP switch and slowly release the brake pedal.

Photocell

Printable View (51 KB)

1. Remove the LH and RH windshield side garnish mouldings. For additional information, refer to Section 501-01 .

2. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1	54044E82	Instrument panel defroster grille
2	19A657	Electrical connector
3	A2906	Screws (2 required)
4	14A597	Photocell

3. To install, reverse the removal procedure.

Interior Lighting Component Location Index

Printable View (342 KB)

Interior Lighting Printable View (12 KB)

The interior lighting system consists of two subsystems: The interior lamps and the demand lamps.

The interior lamps are controlled by the front electronics module (FEM). The interior lamp subsystem consists of the left and right puddle lamps, footwell lamps, map lamps and the grab handle lamps. The FEM controls the interior lamps by providing the ground circuit when a door ajar is detected.

The demand lamps subsystem consists of the glove compartment lamp, luggage compartment lamp, front map lamps, left and right vanity mirror lamps and the rear grab handle reading lamps. Each of these lamps are switched individually and share a common ground circuit.

Both subsystems use the same power supply circuit through switched system power (SSP) relay 3, with the exception of the luggage compartment lamp which is powered through SSP relay 4.

Principles of Operation

NOTE: A new front electronic module (FEM) or rear electronic module (REM) must be reconfigured before installing. REFER to Section 418-00 .

The electronic functions are divided into zones. The FEM controls the front portion of the vehicle and the REM controls the rear portion of the vehicle. These systems rely on the standard corporate protocol (SCP) communication network in order to transmit and receive signals. As a technician, it is very important to understand:

- where the input (command) originates from.
- all information (messages) necessary in order for a feature to operate.
- which module(s) receive(s) the input or command message.
- whether the module which received the input (message) controls the output of the feature, or whether it outputs a message over the SCP communication network to another module.
- which module controls the output of the feature.

FEM Operation

This system is unique in that many of the inputs the FEM receives are delivered via the SCP communication network. These input messages come from other modules connected to the network, such as the rear electronics module (REM), driver door module (DDM), and instrument cluster. The FEM interprets the inputs and, in turn, commands the correct output. The FEM also receives inputs which come directly from components hardwired to the module, such as the front door ajar switches.

Interior Lighting

The FEM controls the outputs to all interior lighting. The lamps are illuminated if any door is ajar. The front door switches are hardwired to the FEM. When either of the two doors is opened, the FEM commands the interior lamps on by supplying the ground circuit. The rear door ajar switches are hardwired to the REM. When any of these doors are ajar, the REM sends a command through the SCP network to the FEM. The FEM then commands the appropriate interior lamps on.

Fault management of the interior lamps provides limited functionality in the event of certain dome or lighting mode inputs, vehicle speed or ignition switch failures. All interior lighting is powered by the switched system power (SSP) feature (see below). A failure of any or all of the SSP feature(s) could cause inoperative interior

lighting. When diagnosing the interior lighting, it is essential to determine if all relative symptoms and DTCs are controlled by the SSP feature.

Switched System Power (SSP)

The SSP is invoked by both the FEM and REM. This function removes power from relays that provide power to the exterior lamps, interior lamps, and power door locks. This is only accomplished when both the FEM and the REM are in the sleep mode. The sleep function of the FEM and REM places the modules in sleep mode when the ignition switch is in the OFF position, and no wake up (inputs) signals occur for 30 minutes. The module will not sleep if the parking lamps or the hazard lamps are active. The following relays are controlled by the SSP function: SSP1, SSP2, SSP3, and SSP4. When either the FEM or REM are not in sleep mode, all SSP relays will be energized. Each relay, when energized, will supply power to multiple features/functions. For additional information, refer to the SSP Relay Index for diagnosis and testing of SSP-related issues.

Interior Lighting

Refer to Wiring Diagrams Cell 89 for schematic and connector information.

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052,or equivalent diagnostic tool with appropriate adapter cable

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Electrical
• Wiring harness • Loose or corroded connections • Battery junction box (BJB) fuses: ♦ 4 (10A) ♦ 5 (10A) ♦ 23 (30A) ♦ 24 (30A) ♦ 25 (40A) ♦ 27 (30A) ♦ 32 (30A) • Central junction box (CJB) fuse 20 (10A) • Lamp(s) • Relay(s) • Headlamp switch • Instrument cluster • Dimmer switch • FEM • REM

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, connect the diagnostic tool to the data link connector and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
   - check that the program card is correctly installed.
   - check the connections to the vehicle.
   - check the ignition switch position.

5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

6. Carry out the diagnostic tool data link test. If the diagnostic tool responds with:
   - SCP+, SCP-, ISO, CAN or UBP circuit fault; all electronic control units no response/not equipped, refer to Section 418-00 .
   - No response/not equipped for FEM, REFER to Section 418-00 .
   - No response/not equipped for REM, REFER to Section 418-00 .
   - System passed, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out self-test diagnostics for the FEM and REM.

7. If the DTCs retrieved are related to the concern, go to FEM Diagnostic Trouble Code (DTC) Index or REM Diagnostic Trouble Code (DTC) Index.

8. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

FEM Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1319	Driver Door Ajar Circuit Failure	FEM	Go To Pinpoint Test C .
B1327	Passenger Door Ajar Circuit Failure	FEM	Go To Pinpoint Test C .
B1342	ECU Is Defective	FEM	CLEAR the DTC. REPEAT the FEM self-test. If DTC B1342 is retrieved, INSTALL a new FEM. REFER to Section 418-00 .
B2477	Module Configuration Failure	FEM	REFER to Section 418-00 .

REM Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B2245	Passenger Rear Door Ajar Circuit Open	REM	Go To Pinpoint Test C .
B1331	Luggage Compartment Ajar Rear Door Circuit Failure	REM	Go To Pinpoint Test E .
B1342	ECU Is Defective	REM	CLEAR the DTC. RETRIEVE the DTCs. If DTC B1342 is retrieved, INSTALL a new REM. REFER to Section 418-00

			.
B2243	Diver Rear Door Ajar Circuit Open	REM	Go To Pinpoint Test C .
B2477	Module Configuration Failure	REM	REFER to Section 418-00 .

SSP Relay Index

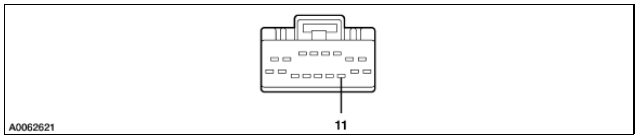
Relay	fuse	Controlled System(s)
SSP1	BJB fuse 27 (30A)	• Driver power door lock (FEM) • LH high beam headlamps (FEM) • RH front park/turn/side marker lamps (FEM) • RH low beam headlamp • Driver exterior rear view mirror • LH front park/turn/side marker lamps (FEM)
SSP2	BJB fuse 32 (30A)	• LH low beam headlamp (FEM) • RH high beam headlamps (FEM) • Passenger exterior rear view mirror (FEM) • Switch illumination backlighting
SSP3	BJB fuse 24 (30A)	• High mounted stop lamp (REM) • RH rear park/stop lamps (REM) • Reversing lamps (REM) • LH rear turn signals (REM) • Interior interior and demand lighting (FEM)
SSP4	BJB fuse 23 (30A)	• LH rear park/stop lamps (REM) • RH rear turn signals (REM) • All passenger door locks (REM) • License lamps • Luggage compartment release solenoid/switch • Fuel door release solenoid/switch • Luggage compartment lamp

When diagnosing an SSP relay, check that all systems for that relay are inoperative. Refer to Section 417-01 .

Symptom Chart

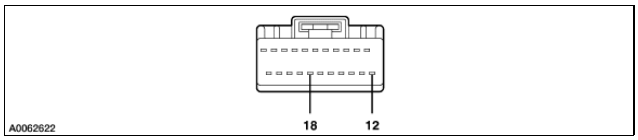
Symptom Chart
Connector Circuit Reference

FEM C201a



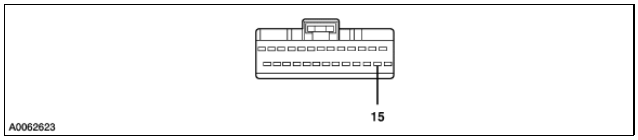
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
11	31-DK20 (BK/RD) FEM power ground	Less than 5 ohms between FEM and ground with FEM disconnected.

FEM C201b



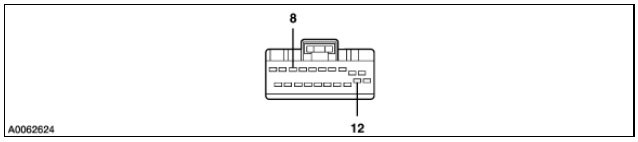
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
12	9-LC36 (BN) RH front puddle lamp ground circuit	Greater than 10 volts between FEM and ground with FEM disconnected. Less than 5 ohms between FEM and RH front puddle lamp.
18	9-LC34 (BN) LH front puddle lamp ground circuit	Greater than 10 volts between FEM and ground with FEM disconnected. Less than 5 ohms between FEM and LH front puddle lamp.

FEM C201e



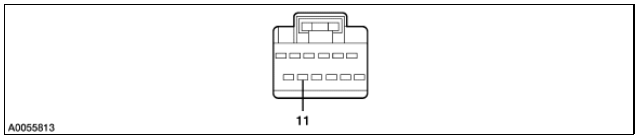
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
15	31S-GL47 (BK/BU) Passenger door ajar switch power circuit	Less than 5 ohms between FEM and ground with passenger door open. Greater than 10,000 ohms between FEM and ground with passenger door closed.

FEM C201f



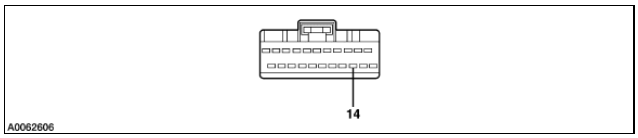
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
8	31S-GL46 (BK/YE) Driver door ajar switch power circuit	Less than 5 ohms between FEM and ground with driver door open. Greater than 10,000 ohms between FEM and ground with driver door closed.
12	31S-LC3 (BK/OG) Interior lamp ground circuit between auxiliary junction box and FEM	Greater than 10 volts between FEM and ground. Greater than 10,000 ohms between FEM and ground.

REM C420a



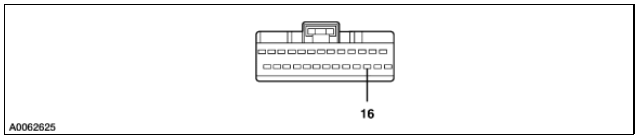
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
11	31S-LB25 (BK/BU) Luggage compartment lamp power circuit	Greater than 10 volts between REM and ground. Greater than 10,000 ohms between REM and ground.

REM C420b



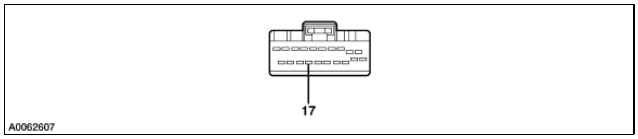
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
14	8-GL20 (WH/BK) Luggage compartment lid ajar switch power circuit	Less than 5 ohms between REM and ground with luggage compartment lid open. Greater than 10,000 ohms between REM and ground with luggage compartment lid closed.

REM C420c



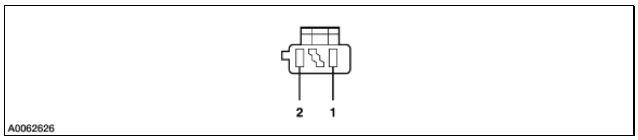
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
16	31S-GL12 (BK/OG) LH rear door ajar switch power circuit	Greater than 10,000 ohms between REM and ground with LH rear door closed. Less than 5 ohms between REM and ground with LH rear door open.

REM C420d



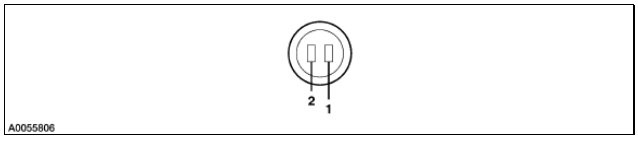
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
17	31S-GL19 (BK/GN) RH rear door ajar switch power circuit	Greater than 10,000 ohms between REM and ground with RH rear door closed. Less than 5 ohms between REM and ground with RH rear door open.

Glove Compartment Lamp C254



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	29S-LB8 (OG) glove compartment lamp power circuit	Greater than 10 volts between glove compartment lamp and ground. Greater than 10,000 ohms between glove compartment lamp and ground with lamp connector disconnected.
2	31-LB8 (BK/OG) glove compartment lamp ground circuit	Less than 5 ohms between glove compartment lamp and ground.

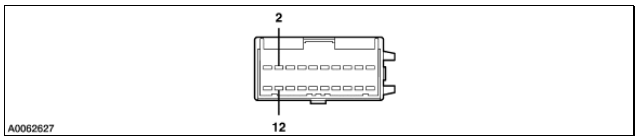
Footwell Lamps C266 and C209



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1 (C266)	31S-LC23 (BK/WH) RH footwell lamp ground circuit	Greater than 10,000 ohms between footwell lamp and ground with FEM disconnected. Less than 5 ohms between footwell lamp and FEM.
1 (C209)		

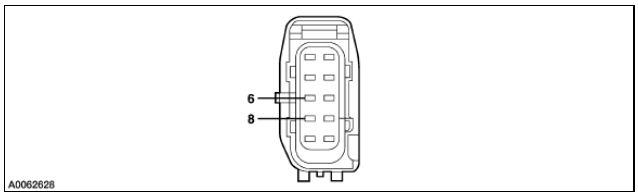
	31S-LC11 (BK/WH) LH footwell lamp ground circuit	Greater than 10,000 ohms between footwell lamp and ground with FEM disconnected. Less than 5 ohms between footwell lamp and FEM.
2 (C266)	29S-LC23 (OG/WH) RH footwell lamp power supply circuit	Greater than 10 volts between RH footwell lamp and ground. Greater than 10,000 ohms between RH footwell lamp and ground with footwell lamp disconnected.
2 (C209)	29S-LC11 (OG/WH) LH footwell lamp power supply circuit	Greater than 10 volts between LH footwell lamp and ground. Greater than 10,000 ohms between LH footwell lamp and ground with footwell lamp disconnected.

Puddle Lamps C520, C601



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
2 (C520)	29S-LC34 (OG/YE) LH puddle lamp power supply circuit	Greater than 10 volts between LH puddle lamp and ground. Greater than 10,000 ohms between LH puddle lamp and ground.
2 (C601)	29S-LC36 (OG/YE) RH puddle lamp power circuit	Greater than 10 volts between RH puddle lamp and ground. Greater than 10,000 ohms between RH puddle lamp and ground.
12 (C520)	9-LC34 (BN) LH puddle lamp ground circuit	Greater than 10,000 ohms between puddle lamp and ground with FEM disconnected. Less than 5 ohms between puddle lamp and FEM.
12 (C601)	9-LC36 (BN) RH puddle lamp ground circuit	Greater than 10,000 ohms between puddle lamp and ground with FEM disconnected. Less than 5 ohms between puddle lamp and FEM.

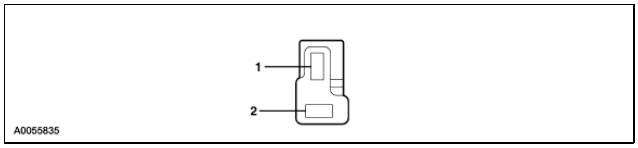
Door Ajar Switches C525, C609, C704, C804



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
6 (C525)	31-AA58 (BK) Driver door ajar switch ground circuit	Less than 5 ohms between door ajar switch and ground.
6 (C609)		Less than 5 ohms between door ajar switch and ground.

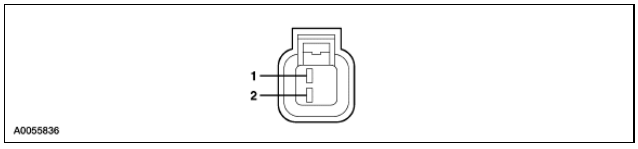
	31-AA58 (BK) Passenger door ajar switch ground circuit	
6 (C704)	31-AA58 (BK) LH rear door ajar switch ground circuit	Less than 5 ohms between door ajar switch and ground.
6 (C804)	31-AA58 (BK) RH rear door ajar switch ground circuit	Less than 5 ohms between door ajar switch and ground.
8 (C525)	31S-GL46 (BK/YE) Driver door ajar switch power circuit	Greater than 10,000 ohms between door ajar switch and ground with door ajar switch and FEM disconnected. Less than 5 ohms between door ajar switch and FEM.
8 (C609)	31S-GL47 (BK/BU) Passenger door ajar switch power circuit	Greater than 10,000 ohms between door ajar switch and ground with door ajar switch and FEM disconnected. Less than 5 ohms between door ajar switch and FEM.
8 (C704)	31S-GL12 (BK/OG) LH rear door ajar switch power circuit	Greater than 10,000 ohms between door ajar switch and ground with door ajar switch and REM disconnected. Less than 5 ohms between door ajar switch and REM.
8 (C804)	31S-GL19 (BK/GN) RH rear door ajar switch power circuit	Greater than 10,000 ohms between door ajar switch and ground with door ajar switch and REM disconnected. Less than 5 ohms between door ajar switch and REM.

Luggage Compartment Lamp C428



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	29S-LB25 (OG/BU) Luggage compartment lamp power circuit	Greater than 10 volts between luggage compartment lamp and ground. Greater than 10,000 ohms between luggage compartment lamp and ground.
2	31S-LB25 (BK/BU) Luggage compartment lamp ground circuit	Greater than 10,000 ohms between luggage compartment lamp and ground with REM disconnected. Less than 5 ohms between luggage compartment lamp and REM.

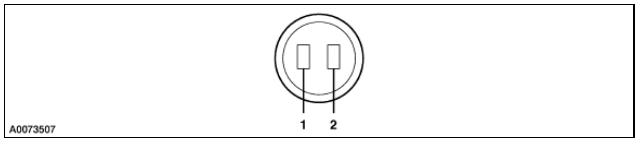
Luggage Compartment Lid Ajar Switch C429



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	8-GL20 (WH/BK) Luggage compartment lid ajar switch power circuit	Greater than 10,000 ohms between luggage compartment lid ajar switch and ground with luggage compartment lid ajar switch disconnected. Less than 5 ohms between luggage compartment lid ajar switch and REM.

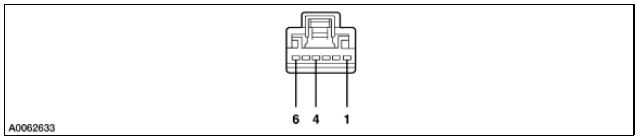
2	31-GL20 (BK/RD) Luggage compartment lid ajar switch ground circuit	Less than 5 ohms between luggage compartment lid ajar switch and ground.

Map Lamps C903, C908



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1 (C903)	31S-LB19 (BK/BU) RH map lamp ground circuit	Greater than 10,000 ohms between map lamp and ground with RH map lamp switch disconnected. Less than 5 ohms between RH map lamp and RH map lamp switch.
1 (C908)	31S-LB12 (BK/YE) LH map lamp ground circuit	Greater than 10,000 ohms between map lamp and ground with LH map lamp switch disconnected. Less than 5 ohms between LH map lamp and LH map lamp switch.
2 (C903)	29S-LB19 (OG/BU) RH map lamp power circuit	Greater than 10 volts between RH map lamp and ground. Greater than 10,000 ohms between RH map lamp and ground.
2 (C908)	29S-LB12 (OG/YE) LH map lamp power circuit	Greater than 10 volts between LH map lamp and ground. Greater than 10,000 ohms between LH map lamp and ground.

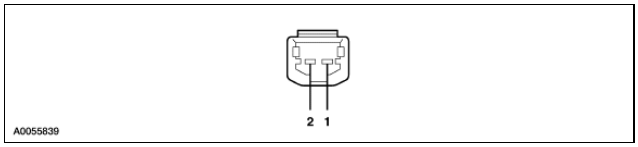
Map Lamps Switches C905, C910



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1 (C905)	31S-LB19 (BK/BU) RH map lamp switch power circuit	Greater than 10,000 ohms between RH map lamp switch and ground with RH map lamp switch and RH map lamp disconnected. Less than 5 ohms between RH map lamp and RH map lamp switch.
1 (C910)	31S-LB12 (BK/YE) LH map lamp switch power circuit	Greater than 10,000 ohms between LH map lamp switch and ground with LH map lamp switch and LH map lamp disconnected. Less than 5 ohms between LH map lamp and LH map lamp switch.
4 (C905)	31-LB20 (BK/OG) RH map lamp, demand lamp function, circuit ground	Less than 5 ohms between map lamp switch and ground.
4 (C910)	31-LB13 (BK/BU) LH map lamp, demand lamp function, circuit ground	Less than 5 ohms between map lamp switch and ground.
6 (C905)	9-LB20 (BN/BU) RH map lamp,	Greater than 10,000 ohms between RH map lamp switch

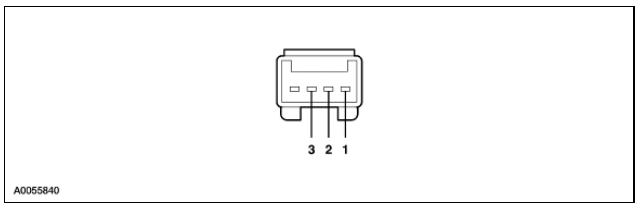
	interior lamp function, circuit ground	and ground with FEM disconnected. Less than 5 ohms between RH map lamp switch and FEM.
6 (C910)	9-LB13 (BN/RD) LH map lamp, interior lamp function, circuit ground	Greater than 10,000 ohms between LH map lamp switch and ground with FEM disconnected. Less than 5 ohms between LH map lamp switch and FEM.

Vanity Mirror Lamps C906, C907



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1 (C906)	31-LB23 (BK/WH) RH vanity mirror lamp ground circuit	Less than 5 ohms between RH vanity mirror lamp and ground.
1 (C907)	31-LB16 (BK/RD) LH vanity mirror lamp ground circuit.	Less than 5 ohms between LH vanity mirror lamp and ground.
2 (C906)	29S-LB23 (OG/WH) RH vanity mirror lamp power circuit	Greater than 10 volts between RH vanity mirror lamp and ground. Greater than 10,000 ohms between RH vanity mirror lamp and ground.
2 (C907)	29S-LB16 (OG/GN) LH vanity mirror lamp power circuit	Greater than 10 volts between LH vanity mirror lamp and ground. Greater than 10,000 ohms between LH vanity mirror lamp and ground.

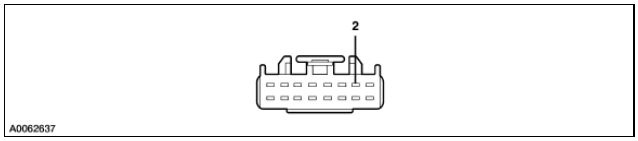
Rear Grab Handle Lamps C9009, C9010



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1 (C9009)	29S-LB14 (OG) LH rear grab handle lamp power supply circuit	Greater than 10 volts between LH rear grab handle lamp and ground. Greater than 10,000 ohms between LH rear grab handle lamp and ground.
1 (C9010)	29S-LB21 (OG/BK) RH rear grab handle lamp power supply circuit	Greater than 10 volts between RH rear grab handle lamp and ground. Greater than 10,000 ohms between RH rear grab handle lamp and ground.
2 (C9009)	31-LB14 (BK) LH rear grab handle lamp, demand lamp function, ground circuit	Less than 5 ohms to ground.
2 (C9010)	31-LB21 (BK) RH rear grab handle	Less than 5 ohms to ground.

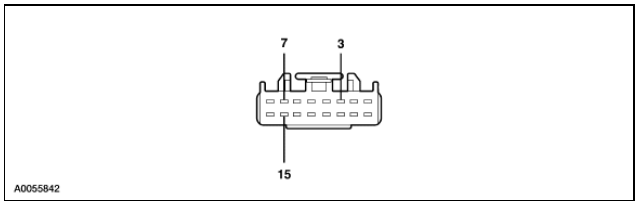
	lamp, demand lamp function, ground circuit	
3 (C9009)	9-LB14 (BN/BU) LH rear grab handle lamp, interior lamp function, ground circuit	Greater than 10,000 ohms between LH rear grab handle lamp and ground with FEM disconnected. Less than 5 ohms between LH rear grab handle lamp and FEM.
3 (C9010)	9-LB21 (BN/GN) RH rear grab handle lamp, interior lamp function, ground circuit	Greater than 10,000 ohms between RH rear grab handle lamp and ground with FEM disconnected. Less than 5 ohms between RH rear grab handle lamp and FEM.

Auxiliary Junction Box C283a



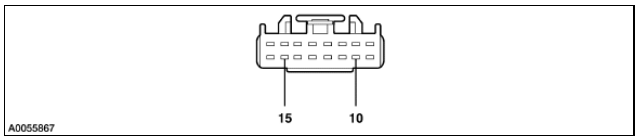
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
2	9-LB1 (BN) interior lamp ground circuit	Greater than 10 volts between auxiliary junction box and ground. Greater than 10,000 ohms between auxiliary junction box and ground.

Auxiliary Junction Box C283b



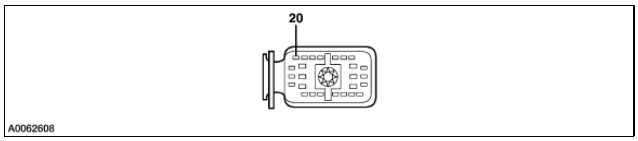
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
3	31S-LC3 (BK/OG) interior lamp ground circuit between auxiliary junction box and FEM	Greater than 10,000 ohms between auxiliary junction box and ground with FEM disconnected. Less than 5 ohms between auxiliary junction box and FEM.
7	29S-LC34 (OG/YE) LH puddle lamp power supply circuit	Greater than 10,000 ohms between auxiliary junction box and ground with LH front puddle lamp disconnected. Less than 5 ohms between auxiliary junction box and LH front puddle lamp.
15	29S-LC5 (OG/GN) LH footwell lamp and LH front puddle lamp power supply circuit	Greater than 10 volts between auxiliary junction box and ground. Greater than 10,000 ohms between auxiliary junction box and ground. Less than 5 ohms between auxiliary junction box and CJB.

Interior Junction Box C283d



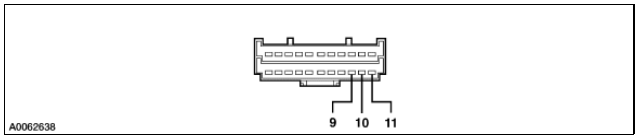
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
10	31S-LC4 (BK/BU) LH and RH footwell lamps ground circuit between LH instrument panel junction block and interior junction box	Greater than 10 volts between interior junction box and ground. Greater than 10,000 ohms between interior junction box and ground with LH instrument panel junction block disconnected. Less than 5 ohms between auxiliary junction box and LH instrument panel junction block.
15	29S-LC11 (OG/WH) LH footwell lamp power supply circuit	Greater than 10,000 ohms between auxiliary junction box and ground with LH footwell lamp disconnected. Less than 5 ohms between auxiliary junction box and LH footwell lamp.

CJB C270d



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
20	29S-LC36 (OG/YE) RH front puddle lamp power supply circuit	Greater than 10,000 ohms to ground with RH front puddle lamp disconnected. Less than 5 ohms between CJB and RH front puddle lamp.

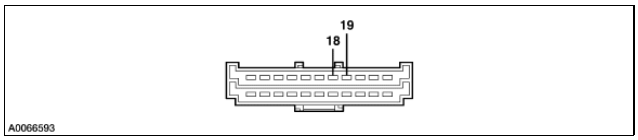
LH Instrument Panel Junction Block C224



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
9	31S-LC4 (BK/BU) LH and RH footwell lamp ground circuit between LH instrument panel junction block and auxiliary junction box	Greater than 10,000 ohms between LH instrument panel junction box and ground with auxiliary junction box disconnected. Less than 5 ohms between LH instrument panel junction box and auxiliary junction box.

10	31S-LC23 (BK/WH) RH footwell lamp ground circuit	Greater than 10,000 ohms between LH instrument panel junction block and ground with RH footwell lamp disconnected. Less than 5 ohms between LH instrument panel junction block and RH footwell lamp.
11	31S-LC11 (BK/WH) LH footwell lamp ground circuit	Greater than 10,000 ohms between LH instrument panel junction block and ground with LH footwell lamp disconnected. Less than 5 ohms between LH instrument panel junction block and LH footwell lamp.

RH Instrument Panel Junction Block C261



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
18	29S-LC23 (OG/WH) RH footwell lamp power supply circuit	Greater than 10,000 ohms between RH instrument panel junction block and ground with RH footwell lamp disconnected. Less than 5 ohms between RH instrument panel junction block and RH footwell lamp.
19	29S-LC1 (OG/BU) glove compartment lamp and RH footwell lamp power supply circuit between the CBJ and RH instrument panel junction block	Greater than 10 volts between RH instrument panel junction block and ground. Greater than 10,000 ohms between RH instrument panel junction block and ground. Less than 5 ohms between RH instrument panel junction block and CJB.

Pinpoint Test A: The Interior Lamps Are Inoperative

Normal Operation

The interior lighting feature provides interior lighting whenever a door is ajar. The interior lamps are controlled through the FEM. The FEM provides the ground circuit for the front dome/map lamps, rear grab handle lamps, RH and LH footwell lamps and the RH and LH puddle lamps through common circuit 29S-LC3 (BK/OG). Power for the interior lamps is supplied through common circuit 29S-LB2 (OG/BU) from switched system power (SSP) relay 3.

Possible Causes

- battery junction box (BJB)
- circuit 29S-LC23 (OG/WH) open
- circuit 31S-LC3 (BK/OG) short to power
- circuit 31-DK20 (BK/RD) open

- FEM

PINPOINT TEST A: THE INTERIOR LAMPS ARE INOPERATIVE

Test Step	Result / Action to Take
A1 CHECK CIRCUIT 30S-DB16 (RD/GN) FOR OPEN	
NOTE: The ignition switch must be cycled from OFF to ON to enable the switched system power feature. The switched system power will remain active for one half-hour after ignition is turned OFF. Refer to Principles of Operation for switched system power operation. • Remove BJB fuse 5 (10A). • Measure the voltage between BJB fuse 5 (10A) pin 1, circuit 30S-DB16 (RD/GN), and ground.  A0004308 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL fuse 5 (10A). GO to A2 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A2 CHECK CIRCUIT 29S-LC23 (OG/WH) FOR AN OPEN	
• Disconnect: RH Footwell Lamp C266. • Measure the voltage between the RH footwell lamp, C266-2, circuit 29S-LC23 (OG/WH), harness side and ground.  A0004309 • **Is the voltage greater than 10 volts?**	**Yes** RECONNECT C266. GO to A3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A3 CHECK CIRCUIT 29S-LC3 (BK/OG) FOR SHORT TO POWER	
• Key in OFF position. • Remove BJB fuse 5 (10A). • Disconnect: FEM C201F. • Measure the voltage between FEM C201f-12, circuit 31S-LC3 (BK/OG), harness side and ground.	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to A4 .

 A0005552 • **Is the voltage greater than 10 volts?**	
A4 CHECK FEM FOR OPENS	
• Install BJB fuse 5 (10A). • Key in ON position. • Connect a 30A fused jumper between FEM C201f-12, circuit 31S-LC3 (BK/OG), harness side and ground.  A0004310 • **Did the interior lamps illuminate?**	**Yes** GO to A5 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A5 CHECK CIRCUIT 31-DK20 (BK/RD) FOR AN OPEN	
• Key in OFF position. • Disconnect: FEM C201a • Measure the resistance between FEM C201a-11, circuit 31-DK20 (BK/RD) harness side and ground.  A0056611 • **Is the resistance less than 5 ohms?**	**Yes** GO to A6 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A6 CHECK FOR CORRECT FEM OPERATION	

• Disconnect all FEM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all FEM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FEM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test B: The Interior Lamps Do Not Turn On With One Door Open

Normal Operation

The interior lighting feature provides interior lighting whenever a door is ajar. The interior lamps are controlled through the FEM. The FEM provides the ground circuit for the front dome/map lamps, rear grab

handle lamps, RH and LH footwell lamps and the RH and LH puddle lamps through common circuit 29S-LC3 (BK/OG). Power for the interior lamps is supplied through common circuit 29S-LB2 (OG/BU) from switched system power (SSP) relay 3. The LH and RH dome/map lamps and LH and RH grab handle lamps share a common power supply splice from circuit 29S-LB2 (OG/BU) and a common ground circuit splice to circuit 9-LB1 (BN/RD). The LH and RH puddle lamps and LH and RH footwell lamps are supplied power from circuit 29S-LB2 (OG/BU) through the central junction box (CJB). All interior lamp ground circuits connect at the auxiliary junction box and combine into one common ground circuit 29S-LC3 (BK/OG).

Possible Causes

- individual interior lamp
- LH map lamp switch
- RH map lamp switch
- LH rear grab handle lamp assembly
- RH rear grab handle lamp assembly
- LH instrument panel junction block
- RH instrument panel junction block
- auxiliary junction box
- central junction box (CJB)
- FEM
- circuit 29S-LC34 (OG/YE) open
- circuit 9-LC34 (BN) open
- circuit 29S-LC36 (OG/YE) open
- circuit 9-LC36 (BN) open
- circuit 9-LB13 (BN/RD) open
- circuit 29S-LB12 (OG/YE) open
- circuit 31S-LB12 (BK/YE) open
- circuit 9-LB20 (BN/BU) open
- circuit 29S-LB19 (OG/BU) open
- circuit 31S-LB19 (BK/BU) open
- circuit 29S-LB14 (OG) open
- circuit 9-LB14 (BN/BU) open
- circuit 29S-LB21 (OG/BK) open
- circuit 9-LB21 (BN/GN) open
- circuit 29S-LC11 (OG/WH) open
- circuit 31S-LC11 (BK/WH) open
- circuit 29S-LC23 (OG/WH) open
- circuit 31S-LC23 (BK/WH) open
- circuit 31S-LC4 (BK/GN) open
- circuit 29S-LC1 (OG/YE) open
- circuit 29S-LC5 (OG/GN) open
- circuit 9-LB1 (BN) open
- circuit 31-DK20 (BK/RD) open

PINPOINT TEST B: THE INTERIOR LAMPS DO NOT TURN ON WITH ONE DOOR OPEN

Test Step	Result / Action to Take
B1 VERIFY INTERIOR LAMP SYMPTOM	
• Verify the interior lamp symptom. • **Is more than one lamp inoperative?**	**Yes** GO to B28 . **No**

	If a puddle lamp is inoperative, GO to B2 . If a map lamp is inoperative, GO to B9 . If a rear grab handle lamp is inoperative, GO to B16 . If a footwell lamp is inoperative, GO to B21 .
B2 VERIFY PUDDLE LAMP SYMPTOM	
• Verify the area of the puddle lamp symptom. • **Is the driver side puddle lamp inoperative?**	**Yes** GO to B3 . **No** GO to B6 .
B3 CHECK CIRCUIT 29S-LC34 (OG/YE) FOR VOLTAGE	
NOTE: The ignition switch must be cycled from OFF to ON to enable the switched system power feature. The switched system power will remain active for one half-hour after the ignition is turned OFF. Refer to Principles of Operation for switched system power operation. • Key in ON position. • Disconnect: Driver Side Puddle Lamp C520. • Measure the voltage between the driver side puddle lamp C520-2, circuit 29S-LC34 (OG/YE), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to B5 . **No** GO to B4 .
B4 CHECK CIRCUIT 29S-L34 (OG/YE) FOR AN OPEN	
• Key in OFF position. • Disconnect: Auxiliary Junction Box C283b. • Measure the resistance between auxiliary junction box C283b-7, circuit 29S-LC34 (OG/YE), harness side and driver side puddle lamp C520-2, circuit 29S-LC34 (OG/YE) harness side.	**Yes** INSTALL a new auxiliary junction box. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 A0056613 • **Is the resistance less than 5 ohms?**	
B5 CHECK CIRCUIT 9-LC34 (BN) FOR AN OPEN	
• Key in OFF position. • Disconnect: FEM C201b. • Measure the resistance between FEM C201b-18, circuit 9-LC34 (BN), harness side and driver side puddle lamp C520-12, circuit 9-LC34 (BN) harness side.  A0056614 • **Is the resistance less than 5 ohms?**	**Yes** GO to B38 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B6 CHECK CIRCUIT 29S-LC36 (OG/YE) FOR VOLTAGE	
NOTE: The ignition switch must be cycled from OFF to ON to enable the switched system power feature. The switched system power will remain active for one half-hour after ignition is turned OFF. Refer to Principles of Operation for switched system power operation. • Key in ON position. • Disconnect: Passenger Side Puddle Lamp C601. • Measure the voltage between the passenger side puddle lamp C601-2, circuit 29S-LC36 (OG/YE), harness side and ground.  A0056612 • **Is the voltage greater than 10 volts?**	**Yes** GO to B8 . **No** GO to B7 .
B7 CHECK CIRCUIT 29S-LC36 (OG/YE) FOR AN OPEN	
• Key in OFF position. • Disconnect: CJB C270d. • Measure the resistance between CJB C270d-20, circuit 29S-LC36 (OG/YE), harness side and passenger side puddle lamp C601-2, circuit 29S-LC36 (OG/YE) harness side.	**Yes** INSTALL a new CJB. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 A0056615 • **Is the resistance less than 5 ohms?**	
B8 CHECK CIRCUIT 9-LC36 (BN) FOR AN OPEN	
• Key in OFF position. • Disconnect: FEM C201b. • Measure the resistance between FEM C201b-12, circuit 9-LC36 (BN), harness side and passenger side puddle lamp C601-12, circuit 9-LC36 (BN), harness side.  A0056616 • **Is the resistance less than 5 ohms?**	**Yes** GO to B38 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B9 VERIFY INTERIOR MAP LAMP SYMPTOM	
• Verify the area of the interior map lamp symptom. • **Is the LH map lamp inoperative?**	**Yes** GO to B10 . **No** GO to B13 .
B10 CHECK LH MAP LAMP SWITCH FOR VOLTAGE	
NOTE: The ignition switch must be cycled from OFF to ON to enable the switched system power feature. The switched system power will remain active for one half-hour after ignition is turned OFF. Refer to Principles of Operation for switched system power operation. • Key in ON position. • Disconnect: LH Front Map Reading Lamp Switch C910. • Measure the voltage between the LH front map reading lamp switch C910-1, circuit 31S-LB12 (BK/YE), harness side and ground.  A0066592 • **Is the voltage greater than 10 volts?**	**Yes** GO to B11 . **No** GO to B12 .
B11 CHECK CIRCUIT 9-LB13 (BN/RD) FOR AN OPEN	

• Measure the resistance between LH map lamp switch C910-6, circuit 9-LB13 (BN/RD), harness side and ground.  A0004317 • Open the driver door. • **When the driver door is opened, does resistance drop to less than 5 ohms?**	**Yes** INSTALL a new front map lamp assembly. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B12 CHECK CIRCUITS 29S-LB12 (OG/YE) AND 31S-LB12 (BK/YE) FOR AN OPEN	
• Disconnect: LH Front Map Lamp C908. • Measure the voltage between LH front map lamp bulb C908-2, circuit 29S-LB12 (OG/YE), harness side and ground.  A0062610 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit 31S-LB12 (BK/YE). CLEAR the DTCs. REPEAT the self-test. **No** REPAIR circuit 29S-LB12 (OG/YE). CLEAR the DTCs. REPEAT the self-test.
B13 CHECK THE RH MAP LAMP SWITCH FOR VOLTAGE	
NOTE: The ignition switch must be cycled from OFF to ON to enable the switched system power feature. The switched system power will remain active for one half-hour after ignition is turned OFF. Refer to Principles of Operation for switched system power operation. • Disconnect: RH Front Map Lamp Switch C905. • Key in ON position. • Measure the voltage between the RH front map lamp switch C905-1, circuit 31S-LB19 (BK/BU), harness side and ground.  A0066592 • **Is the voltage greater than 10 volts?**	**Yes** GO to B14 . **No** GO to B15 .
B14 CHECK CIRCUIT 9-LB20 (BN/BU) FOR AN OPEN	

• Measure the resistance between RH front map lamp switch C905-6, circuit 9-LB20 (BN/BU), harness side and ground.  A0004317 • Open the driver door. • **When the driver door is opened, does resistance drop to less than 5 ohms?**	**Yes** INSTALL a new front map lamp assembly. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B15 CHECK CIRCUITS 29S-LB19 (OG/BU) AND 31S-LB19 (BK/BU) FOR AN OPEN	
• Disconnect: RH Front Map Lamp C903. • Measure the voltage between RH front map lamp C903-2, circuit 29S-LB19 (OG/BU), harness side and ground.  A0062610 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit 31S-LB19 (BK/BU). CLEAR the DTCs. REPEAT the self-test. **No** REPAIR circuit 29S-LB19 (OG/BU). CLEAR the DTCs. REPEAT the self-test.
B16 VERIFY GRAB HANDLE INTERIOR LAMP SYMPTOM	
• Verify the area of the rear grab handle interior lamp symptom. • **Is the LH rear grab handle interior lamp inoperative?**	**Yes** GO to B17 . **No** GO to B19 .
B17 CHECK CIRCUIT 29S-LB14 (OG)	
NOTE: The ignition switch must be cycled from OFF to ON to enable the switched system power feature. The switched system power will remain active for one half-hour after ignition is turned OFF. Refer to Principles of Operation for switched system power operation. • Disconnect: LH Rear Grab Handle Lamp C9009. • Key in ON position. • Measure the voltage between the LH rear grab handle lamp C9009-1, circuit 29S-LB14 (OG) harness side and ground.	**Yes** GO to B18 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 A0056617 • **Is the voltage greater than 10 volts?**	
B18 CHECK CIRCUIT 9-LB14 (BN/BU) FOR AN OPEN	
• Measure the resistance between the LH rear grab handle lamp C9009-3, circuit 9-LB14 (BN/BU) harness side and ground.  A0056618 • Open the driver door. • **When the driver door is opened, does the resistance drop to less than 5 ohms?**	**Yes** INSTALL a new LH rear grab handle lamp assembly. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR circuit 9-LB14 (BN/BU). CLEAR the DTCs. REPEAT the self-test.
B19 CHECK CIRCUIT 29S-LB21 (OG/BK)	
NOTE: The ignition switch must be cycled from OFF to ON to enable the switched system power feature. The switched system power will remain active for one half-hour after ignition is turned OFF. Refer to Principles of Operation for switched system power operation. • Disconnect: RH Rear Grab Handle Lamp C9010. • Key in ON position. • Measure the voltage between the RH rear grab handle lamp C9010-1, circuit 29S-LB21 (OG/BK) harness side and ground.  A0056617 • **Is the voltage greater than 10 volts?**	**Yes** GO to B20 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B20 CHECK CIRCUIT 9-LB21 (BN/GN) FOR AN OPEN	
• Measure the resistance between the RH rear grab handle lamp C9010-3, circuit 9-LB21 (BN/GN) harness side and ground.	**Yes** INSTALL a new RH rear grab handle lamp assembly. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR circuit 9-LB21 (BN/GN). CLEAR the DTCs. REPEAT the self-test.

 • Open the driver door. • **When the driver door is opened, does the resistance drop to less than 5 ohms?**	
B21 VERIFY INTERIOR FRONT FOOTWELL LAMP SYMPTOM	
• Verify the area of the front footwell interior lamp symptom. • **Are both front footwell lamps inoperative?**	**Yes** GO to B28 . **No** If the LH footwell lamp is inoperative, GO to B22 . If the RH footwell lamp is inoperative, GO to B25 .
B22 CHECK CIRCUIT 29S-LC11 (OG/WH) FOR VOLTAGE	
NOTE: The ignition switch must be cycled from OFF to ON to enable the switched system power feature. The switched system power will remain active for one half-hour after ignition is turned OFF. Refer to Principles of Operation for switched system power operation. • Key in ON position. • Disconnect: LH Front Footwell Lamp C209. • Measure the voltage between the LH front footwell lamp C209-2, circuit 29S-LC11 (OG/WH), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to B24 . **No** GO to B23 .
B23 CHECK CIRCUIT 29S-LC11 (OG/WH) FOR AN OPEN	
• Key in OFF position. • Disconnect: Auxiliary Junction Box C283d. • Measure the resistance between the LH front footwell lamp C209-2, circuit 29S-LC11 (OG/WH), harness side and auxiliary junction box C283d-15, circuit 29S-LC11 (OG/WH), harness side.	**Yes** INSTALL a new auxiliary junction box. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 A0004320 • **Is the resistance less than 5 ohms?**	
B24 CHECK CIRCUIT 31S-LC11 (BK/WH) FOR AN OPEN	
• Key in OFF position. • Disconnect: LH Instrument Panel Junction Block C224. • Measure the resistance between LH instrument panel junction block, C224-11, circuit 31S-LC11 (BK/WH), harness side and LH front footwell lamp C209-1, circuit 31S-LC11 (BK/WH), harness side.  A0056619 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR LH instrument panel junction block, C224. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B25 CHECK CIRCUIT 29S-LC23 (OG/WH) FOR VOLTAGE	
NOTE: The ignition switch must be cycled from OFF to ON to enable the switched system power feature. The switched system power will remain active for one half-hour after ignition is turned OFF. Refer to Principles of Operation for switched system power operation. • Key in ON position. • Disconnect: RH Front Footwell Lamp Bulb C266. • Measure the voltage between the RH front footwell lamp C266-2, circuit 29S-LC23 (OG/WH), harness side and ground.  A0004309 • **Is the voltage greater than 10 volts?**	**Yes** GO to B27 . **No** GO to B26 .
B26 CHECK CIRCUIT 29S-LC23 (OG/WH) FOR AN OPEN	
• Key on OFF position. • Disconnect: RH Instrument Panel Junction Block C261. • Measure the resistance between the RH front footwell lamp C266-2, circuit 29S-LC23 (OG/WH), harness side and RH instrument panel junction block, C261-18, circuit 29S-LC23 (OG/WH) harness side.	**Yes** Verify if the glove box lamp is operating correctly. If it is OK, REPAIR RH instrument panel junction block, C261. CLEAR the DTCs. REPEAT the self-test. If the glove box lamp is not

 • **Is the resistance less than 5 ohms?**	operating correctly, GO to B28 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B27 CHECK CIRCUIT 31S-LC23 (BK/WH) FOR AN OPEN	
• Key on OFF position. • Disconnect: LH Instrument Panel Junction Block C224. • Measure the resistance between the LH instrument panel junction block, C224-10, circuit 31S-LC23 (BK/WH), harness side and RH front footwell lamp C266-1, circuit 31S-LC23 (BK/WH), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** REPAIR LH instrument panel junction block, C224. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B28 CHECK LH AND RH PUDDLE LAMPS	
• Verify the symptom. • **Are both puddle lamps inoperative?**	**Yes** INSTALL a new CJB. CLEAR the DTCs. REPEAT the self-test. **No** GO to B29 .
B29 CHECK LH AND RH FRONT FOOTWELL LAMPS	
• Verify the symptom. • **Are both front footwell interior lamps inoperative?**	**Yes** GO to B30 . **No** GO to B32 .
B30 CHECK VOLTAGE TO AUXILIARY JUNCTION BOX	
• Disconnect: Auxiliary Junction Box 283d. • Measure the voltage between the auxiliary junction box C283d-10, circuit 31S-LC4 (BK/BU), harness side and ground.  	**Yes** INSTALL a new auxiliary junction box. CLEAR the DTCs. REPEAT the self-test. **No** GO to B31 .

• **Is the voltage greater than 10 volts?**	
B31 CHECK CIRCUIT 31S-LC4 (BK/GN) FOR AN OPEN	
• Disconnect: LH Instrument Panel Junction Block C224. • Measure the resistance between the LH instrument panel junction block, C224-9, circuit 31S-LC4 (BK/BU), harness side and auxiliary junction box C283d-10, circuit 31S-LC4 (BK/BU), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** REPAIR LH instrument panel junction block. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B32 CHECK RH FRONT FOOTWELL LAMP AND GLOVE BOX LAMP	
• Verify the symptom. • **Are the RH front footwell and glove box lamps the only lamps that are inoperative?**	**Yes** GO to B33 . **No** GO to B34 .
B33 CHECK CIRCUIT 29S-LC1 (OG/YE)	
• Disconnect: RH Instrument Panel Junction Block C261. • Key in ON position. • Measure the voltage between RH instrument panel junction block, C261-19, circuit 29S-LC1 (OG/BU), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** REPAIR RH instrument panel junction block. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR circuit 29S-LC1 (OG/YE). CLEAR the DTCs. REPEAT the self-test.
B34 CHECK LH FOOTWELL LAMP AND LH PUDDLE LAMP	
• Verify the symptom. • **Are the LH footwell and LH puddle lamps the only lamps that are inoperative?**	**Yes** GO to B35 . **No** GO to B36 .
B35 CHECK CIRCUIT 29S-LC5 (OG/GN)	
• Disconnect: Auxiliary Junction Box C283b. • Key in ON position. • Measure the voltage between the auxiliary junction box C283b-15, circuit 29S-LC5 (OG/GN), harness side and	**Yes** INSTALL a new auxiliary junction box. CLEAR the DTCs. REPEAT the self-test.

ground.  A0062641 • **Is the voltage greater than 10 volts?**	**No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B36 CHECK BOTH MAP AND BOTH GRAB HANDLE LAMPS OPERATION AT THE AUXILIARY JUNCTION BOX	
• Disconnect: Auxiliary Junction Box C283a. • Connect a 10A fused jumper between auxiliary junction box C283a-2, circuit 9-LB1 (BN), harness side and ground.  A0062636 • **Do both map and both rear grab handle lamps illuminate?**	**Yes** INSTALL a new auxiliary junction box. CLEAR the DTCs. REPEAT the self-test. **No** GO to B37 .
B37 CHECK CIRCUIT 9-LB1 (BN) FOR AN OPEN	
• Key in OFF position. • Disconnect: LH Rear Grab Handle Lamp C9009. • Measure the resistance between the LH rear grab handle lamp, C9009-3, circuit 9-LB14 (BN/BU), harness side and auxiliary junction box C283a-2, circuit 9-LB1 (BN), harness side.  A0056624 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR circuit 29S-LB2 (OG/BU). CLEAR the DTCs. REPEAT the self-test. **No** REPAIR circuit 9-LB1 (BN). CLEAR the DTCs. REPEAT the self-test.
B38 CHECK CIRCUIT 31-DK20 (BK/RD) FOR AN OPEN	
• Key in OFF position. • Disconnect: FEM C201a • Measure the resistance between FEM C201a-11, circuit 31-DK20 (BK/RD) harness side and ground.	**Yes** GO to B39 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 A0056611 • **Is the resistance less than 5 ohms?**	
B39 CHECK FOR CORRECT FEM OPERATION	

• Disconnect all FEM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all FEM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FEM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: The Interior Lamps Stay On Continuously

Normal Operation

The interior lighting feature provides interior lighting whenever a door is ajar. The interior lamps are controlled through the FEM. The FEM provides the ground circuit for the front dome/map lamps, rear grab handle lamps, RH and LH footwell lamps and the RH and LH puddle lamps through common circuit 31S-LC3 (BK/OG). Power for the interior lamps is supplied through common circuit 29S-LB2 (OG/BU) from switched system power (SSP) relay 3. The LH and RH dome/map lamps and LH and RH grab handle lamps share a common power supply splice from circuit 29S-LB2 (OG/BU) and a common ground circuit splice to circuit 9-LB1 (BN). The LH and RH puddle lamps and LH and RH footwell lamps are supplied power from circuit 29S-LB2 (OG/BU) through the central junction box (CJB). All interior lamp ground circuits connect at the auxiliary junction box and combine into one common ground circuit 29S-LC3 (OG).

Possible Causes

- driver door ajar switch
- passenger door ajar switch
- LH rear passenger door ajar switch
- RH rear passenger door ajar switch
- map lamp switches
- rear grab handle lamp switches
- FEM
- REM
- circuit 31-AA58 (BK) open
- circuit 31S-GL46 (BK/YE) open
- circuit 31S-GL47 (BK/BU) open
- circuit 31S-GL12 (BK/OG) short to ground
- circuit 31S-GL19 (BK/GN) short to ground
- circuit 31S-LC3 (OG/BK) short to ground
- circuit 9-LC34 (BN) short to ground
- circuit 9-LB1 (BN) short to ground

PINPOINT TEST C: THE INTERIOR LAMPS STAY ON CONTINUOUSLY

Test Step	Result / Action to Take
C1 USE THE RECORDED RESULTS FROM FEM SELF-TESTS	
• Use the recorded FEM continuous and self-test DTCs. • **Are any DTCs recorded?**	**Yes** If DTC B1319, GO to C3 . If DTC B1327, GO to C6 . For all other DTCs, REFER to DTC index in this section. **No** GO to C2 .
C2 USE THE RECORDED RESULTS FROM REM SELF-TESTS	
• Use the recorded REM continuous and self-test DTCs. • **Are any DTCs recorded?**	**Yes** If DTC B1335, GO to C20 . If DTC B1571, GO to C23 . For all other DTCs, REFER to DTC index in this section. **No** GO to C9 .
C3 CHECK THE DRIVER DOOR AJAR SWITCH	
• Key in OFF position. • Disconnect: Driver Door Lock Actuator C525. • Connect a fused jumper wire between driver door lock actuator C525-6, circuit 31-AA58 (BK), harness side and C525-8, circuit 31S-GL46 (BK/YE), harness side.  A0005553 • **Did the interior lamps tun OFF after 20-30 seconds?**	**Yes** INSTALL a new driver door lock actuator/ajar switch. REFER to Section 419-01 . CLEAR the DTCs. REPEAT the self-test. **No** GO to C4 .
C4 CHECK CIRCUIT 31-AA58 (BK) FOR AN OPEN	
• Measure the resistance between driver door lock actuator C525-6, circuit 31-AA58 (BK), harness side and ground.	**Yes** GO to C5 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 A0005554 • **Is the resistance less than 5 ohms?**	
C5 CHECK CIRCUIT 31S-GL46 (BK/YE) FOR AN OPEN	
• Disconnect: FEM C201f. • Measure the resistance between driver door lock actuator, C525-8, circuit 31S-GL46 (BK/YE), harness side and FEM, C201f-8, circuit 31S-GL46 (BK/YE), harness side.  A0004332 • **Is the resistance less than 5 ohms?**	**Yes** GO to C26 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C6 CHECK THE FRONT PASSENGER DOOR AJAR SWITCH	
• Key in OFF position. • Disconnect: Front Passenger Door Lock Actuator C609. • Connect a fused jumper wire between front passenger door lock actuator, C609-6, circuit 31-AA58 (BK), harness side and C609-8, circuit 31S-GL47 (BK/BU), harness side.  A0005553 • **Did the interior lamps tun OFF after 20-30 seconds?**	**Yes** INSTALL a new passenger door lock actuator/ajar switch. REFER to Section 419-01 . CLEAR the DTCs. REPEAT the self-test. **No** GO to C7 .
C7 CHECK CIRCUIT 31-AA58 (BK) FOR AN OPEN	
• Measure the resistance between front passenger door lock actuator, C609-6, circuit 31-AA58 (BK), harness side and ground.	**Yes** GO to C8 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 A0005554 • **Is the resistance less than 5 ohms?**	
C8 CHECK CIRCUIT 31S-GL47 (BK/BU) FOR AN OPEN	
• Key in OFF position. • Disconnect: FEM C201e. • Measure the resistance between front passenger door lock actuator, C609-8, circuit 31S-GL47 (BK/BU), harness side and FEM, C201e-15, circuit 31S-GL47 (BK/BU), harness side.  A0004333 • **Is the resistance less than 5 ohms?**	**Yes** GO to C26 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C9 CHECK LH FRONT MAP READING LAMP OPERATION	
• Key in ON position. • Activate the LH front map reading lamp demand switch. • **Do all other interior lamps turn OFF?**	**Yes** GO to C12 . **No** GO to C10 .
C10 CHECK RH FRONT MAP READING LAMP OPERATION	
• Activate the RH front map lamp switch. • **Do all other interior lamps turn OFF?**	**Yes** GO to C13 . **No** GO to C11 .
C11 CHECK LH GRAB HANDLE LAMP SWITCH OPERATION	
• Activate the LH rear grab handle lamp switch. • **Do all other interior lamps turn OFF?**	**Yes** INSTALL a new LH rear grab handle lamp assembly. CLEAR the DTCs. REPEAT the self-test. **No** GO to C14 .
C12 CHECK CIRCUIT 31S-LB12 (BK/YE) FOR SHORT TO GROUND	
• Disconnect: LH Front Map Reading Lamp Switch C910.	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

• **Does the LH front map lamp stay ON?**	**No** INSTALL a new front map lamp assembly. CLEAR the DTCs. REPEAT the self-test.
C13 CHECK CIRCUIT 31S-LB19 (BK/BU) FOR SHORT TO GROUND	
• Disconnect: RH Front Map Reading Lamp Switch C905. • **Does the RH front map lamp stay ON?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new front map lamp assembly. CLEAR the DTCs. REPEAT the self-test.
C14 CHECK RH GRAB HANDLE LAMP SWITCH OPERATION	
• Activate the RH rear grab handle lamp switch. • **Do all other interior lamps turn off?**	**Yes** INSTALL a new RH rear grab handle lamp assembly. CLEAR the DTCs. REPEAT the self-test. **No** GO to C15 .
C15 ISOLATE CIRCUIT 31S-LC3 (BK/OG) AND FEM FOR SHORT TO GROUND	
• Key in OFF position. • Disconnect: Auxiliary Junction Box C283b. • Measure the resistance between auxiliary junction box, C283b-3, circuit 31S-LC3 (BK/OG), harness side and ground.  • **Is resistance greater than 10,000 ohms?**	**Yes** GO to C17 . **No** GO to C16 .
C16 CHECK CIRCUIT 31S-LC3 (BK/OG) FOR SHORT TO GROUND	
• Disconnect: FEM C201f. • Measure the resistance between auxiliary junction box C283b-3, circuit 31S-LC3 (BK/OG), harness side and ground.  	**Yes** GO to C26 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

• **Is the resistance greater than 10,000 ohms?**	
C17 CHECK CIRCUIT 9-LC34 (BN) FOR SHORT TO GROUND	
• Key in OFF position. • Disconnect: Auxiliary Junction Box C283b. • **Are all interior lamps still on?**	**Yes** GO to C18 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C18 ISOLATE THE FOOTWELL LAMP CIRCUITS FOR SHORT TO GROUND	
• Disconnect: Auxiliary Junction Box C283d. • **Are all the interior lamps still on?**	**Yes** GO to C19 . **No** REPAIR circuit 31S-LC4 (OG/YE). CLEAR the DTCs. REPEAT the self-test.
C19 CHECK CIRCUITS 9-LB1 (BN) AND 9-LC36 (BN) FOR SHORT TO GROUND	
• Disconnect: Auxiliary Junction Box C283a. • Measure the resistance between auxiliary junction box, C283a-2, circuit 9-LB1 (BN), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new auxiliary junction box. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
C20 CHECK THE RH REAR PASSENGER DOOR AJAR SWITCH	
• Key in OFF position. • Disconnect: RH Rear Passenger Door Lock Actuator C804. • Connect a fused jumper wire between RH rear passenger door lock actuator C804-6, circuit 31-AA58 (BK), harness side and C804-8, circuit 31S-GL19 (BK/GN), harness side.  • **Did the interior lamps tun OFF after 20-30 seconds?**	**Yes** INSTALL a new RH rear passenger door lock actuator/ajar switch. REFER to Section 419-01 . CLEAR the DTCs. REPEAT the self-test. **No** GO to C21 .

C21 CHECK CIRCUIT 31-AA58 (BK) FOR AN OPEN	
• Measure the resistance between RH rear passenger door lock actuator, C804-6, circuit 31-AA58 (BK), harness side and ground.  A0005554 • **Is the resistance less than 5 ohms?**	**Yes** GO to C22 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C22 CHECK CIRCUIT 31S-GL19 (BK/GN) FOR AN OPEN	
• Disconnect: REM C420d. • Measure the resistance between RH rear passenger door lock actuator, C804-8, circuit 31S-GL19 (BK/GN), harness side and REM C420d-17, circuit 31S-GL19 (BK/GN), harness side.  A0004335 • **Is the resistance less than 5 ohms?**	**Yes** GO to C27 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C23 CHECK THE LH REAR PASSENGER DOOR AJAR SWITCH	
• Key in OFF position. • Disconnect: LH Rear Passenger Door Lock Actuator C704. • Connect a fused jumper wire between LH rear passenger door lock actuator, C704-6, circuit 31-AA58 (BK), harness side and C704-8, circuit 31S-GL12 (BK/OG), harness side.  A0005553 • **Did the interior lamps tun OFF after 20-30 seconds?**	**Yes** INSTALL a new LH rear passenger door lock actuator/ajar switch. REFER to Section 419-01 . CLEAR the DTCs. REPEAT the self-test. **No** GO to C24 .
C24 CHECK CIRCUIT 31-AA58 (BK) FOR AN OPEN	

• Measure the resistance between LH rear passenger door lock actuator C704-6, circuit 31-AA58 (BK), harness side and ground.  A0005554 • **Is the resistance less than 5 ohms?**	**Yes** GO to C25 . **No** REPAIR circuit 31-AA58 (BK). CLEAR the DTCs. REPEAT the self-test.
C25 CHECK CIRCUIT 31S-GL12 (BK/OG) FOR AN OPEN	
• Disconnect: REM C420c. • Measure the resistance between LH rear passenger door lock actuator C704-8, circuit 31S-GL12 (BK/OG), harness side and REM C420c-16, circuit 31S-GL12 (BK/OG), harness side.  A0004336 • **Is the resistance less than 5 ohms?**	**Yes** GO to C27 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C26 CHECK FOR CORRECT FEM OPERATION	

• Disconnect all FEM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all FEM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FEM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

C27 CHECK FOR CORRECT REM OPERATION	

• Disconnect all REM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all REM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new REM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: The Glove Compartment, LH and RH Map Lamps, LH and RH Vanity Mirror Lamps or LH and RH Grab Handle Lamps are Inoperative

Normal Operation

The demand lamps consist of the glove compartment lamp, LH and RH map lamps, LH and RH vanity mirror lamps and the LH and RH grab handle lamps. Switched system power is supplied to these lamps through SSP relay 3, and circuit 29S-LB2 (OG/BU). The glove compartment lamp uses ground circuit 31-LB8 (BK/OG). All other demand lamps are spliced into a common ground circuit 31-LB3 (BK/OG).

Possible Causes

- circuit 29S-LB8 (OG) open
- circuit 31-LB8 (BK/OG) open
- circuit 29S-LB16 (OG/GN) open
- circuit 31-LB16 (BK/RD) open
- circuit 29S-LB23 (OG/WH) open
- circuit 31-LB23 (BK/WH) open
- circuit 29S-LB14 (OG) open
- circuit 31-LB14 (BK) open
- circuit 29S-LB21 (OG/BK) open
- circuit 31-LB21 (BK) open
- individual demand lamp
- individual demand lamp switch

PINPOINT TEST D: THE GLOVE COMPARTMENT, LH AND RH MAP LAMPS, LH AND RH VANITY MIRROR LAMPS OR LH AND RH REAR GRAB HANDLE LAMPS ARE INOPERATIVE

Test Step	Result / Action to Take
D1 VERIFY LAMP SYMPTOM	
NOTE: If any of the interior lamps are also inoperative, refer to GO to Symptom Chart . If multiple lamps are inoperative, Go To Pinpoint Test C . • Verify the inoperative lamp. • **Is the glove compartment lamp inoperative?**	**Yes** GO to D2 . **No** If the LH hand visor lamp is inoperative, GO to D4 . If the RH hand visor lamp is inoperative, GO to D6 . If a map lamp is inoperative, GO to D8 . If the LH rear grab handle lamp is inoperative, GO to D9 . If the RH rear grab handle is inoperative, GO to D11 .
D2 CHECK CIRCUIT 29S-LB8 (OG) FOR AN OPEN	

NOTE: The ignition switch must be cycled from OFF to ON to enable the switched system power feature. The switched system power will remain active for one half-hour after ignition is turned OFF. Refer to Principles of Operation for switched system power operation. • Disconnect: Glove Compartment Lamp And Switch C254. • Measure the voltage between glove compartment lamp and switch, C254-1, circuit 29S-LB8 (OG), harness side and ground.  A0005603 • **Is the voltage greater than 10 volts?**	**Yes** GO to D3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
D3 CHECK CIRCUIT 31-LB8 (BK/OG) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between glove compartment lamp and switch, C254-2, circuit 31-LB8 (BK/OG), harness side and ground.  A0062611 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new glove compartment lamp and switch. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
D4 CHECK CIRCUIT 29S-LB16 (OG/GN) FOR OPEN	
NOTE: The ignition switch must be cycled from OFF to ON to enable the switched system power feature. The switched system power will remain active for one half-hour after ignition is turned OFF. Refer to Principles of Operation for switched system power operation. • Disconnect: LH Vanity Mirror Lamp And Switch C907. • Measure the voltage between LH vanity mirror lamp and switch C907-2, circuit 29S-LB16 (OG/GN), harness side and ground.  A0062634 • **Is the voltage greater than 10 volts?**	**Yes** GO to D5 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
D5 CHECK CIRCUIT 31-LB16 (BK/RD) FOR AN OPEN	

• Key in OFF position. • Measure the resistance between LH vanity mirror lamp and switch C907-1, circuit 31-LB16 (BK/RD), harness side and ground.  A0062635 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new LH vanity mirror lamp and switch. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
D6 CHECK CIRCUIT 29S-LB23 (OG/WH) FOR AN OPEN	
NOTE: The ignition switch must be cycled from OFF to ON to enable the switched system power feature. The switched system power will remain active for one half-hour after ignition is turned OFF. Refer to Principles of Operation for switched system power operation. • Key in OFF position. • Disconnect: RH Vanity Mirror Lamp And Switch C906. • Key in ON position. • Measure the voltage between RH vanity mirror lamp and switch C906-2, circuit 29S-LB23 (OG/WH), harness side and ground.  A0062634 • **Is the voltage greater than 10 volts?**	**Yes** GO to D7 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
D7 CHECK CIRCUIT 31-LB23 (BK/WH) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between RH vanity mirror lamp and switch C906-1, circuit 31-LB23 (BK/WH), harness side and ground.  A0062635 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new RH vanity mirror lamp and switch. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
D8 CHECK GROUND CIRCUIT TO MAP SWITCH	
• Key in OFF position. • Disconnect: Front Map Reading Lamp Switch C905 Or C910. • For the LH front map reading lamp switch measure the resistance between C910-4, circuit 31-LB13 (BK/BU), harness side and	**Yes** INSTALL a new front map lamp assembly. CLEAR the DTCs. REPEAT the self-test.

ground. For the RH front map reading lamp switch measure the resistance between C905-4, circuit 31-LB20 (BK/OG), harness side and ground.  A0005604 • **Are the resistance less than 5 ohms?**	**No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
D9 CHECK CIRCUIT 29S-LB14 (OG) FOR OPEN	
NOTE: The ignition switch must be cycled from OFF to ON to enable the switched system power feature. The switched system power will remain active for one half-hour after ignition is turned OFF. Refer to Principles of Operation for switched system power operation. • Disconnect: LH Rear Grab Handle Lamp And Switch C9009. • Measure the voltage between LH rear grab handle lamp and switch, C9009-1, circuit 29S-LB14 (OG), harness side and ground.  A0056617 • **Is the voltage greater than 10 volts?**	**Yes** GO to D10 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
D10 CHECK CIRCUIT 31-LB14 (BK) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between LH rear grab handle lamp and switch, C9009-2, circuit 31-LB14 (BK), harness side and ground.  A0056627 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new LH rear grab handle lamp and switch. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
D11 CHECK CIRCUIT 29S-LB21 (OG/BK) FOR AN OPEN	
NOTE: The ignition switch must be cycled from OFF to ON to enable the switched system power feature. The switched system power will remain active for one half-hour after ignition is turned OFF. Refer to Principles of Operation for switched system power operation. • Key in OFF position. • Disconnect: RH Rear Grab Handle Lamp And Switch C9010.	**Yes** GO to D12 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

• Key in ON position. • Measure the voltage between RH rear grab handle lamp and switch C9010-1, circuit 29S-LB21 (OG/BK), harness side and ground.  A0056617 • **Is the voltage greater than 10 volts?**	
D12 CHECK CIRCUIT 31-LB21 (BK) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between RH rear grab handle lamp and switch, C9010-2, circuit 31-LB21 (BK), harness side and ground.  A0056627 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new RH rear grab handle lamp and switch. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test E: The Interior Lamps Stay On Continuously Luggage Compartment Lamp Only

Normal Operation

The luggage compartment lamp is controlled through the REM. SSP relay 4 supplies power to the lamp through circuit 29S-LB4 (OG/BK). The luggage compartment lid ajar switch provides a ground signal to the REM through circuit 8-GL20 (WH/BK) which, in turn, provides a ground signal to the luggage compartment lamp through circuit 31S-LB25 (BK/BU).

Possible Causes

- circuit 31S-LB25 (BK/BU) short to ground
- circuit 31-GL20 (BK/RD) open
- circuit 8-GL20 (WH/BK) open
- luggage compartment lid ajar switch
- REM

PINPOINT TEST E: THE INTERIOR LAMPS STAY ON CONTINUOUSLY LUGGAGE COMPARTMENT LAMP ONLY

Test Step	Result / Action to Take
E1 RETRIEVE DIAGNOSTIC TROUBLE CODES	
• Use recorded results from REM self-test. • **Are any DTCs recorded?**	**Yes** If B1331 GO to E4 . For all other DTCs REFER to

	the REM Diagnostic Trouble Code (DTC) Index in this section. **No** GO to E2 .
E2 CHECK THE LUGGAGE COMPARTMENT LID AJAR SWITCH INPUT TO THE REM	
NOTE: The ignition switch must be cycled from OFF to ON to enable the switched system power feature. The switched system power will remain active for one half-hour after ignition is turned OFF. Refer to Principles of Operation for switched system power operation. • Connect the diagnostic tool. • Enter the following diagnostic mode on the diagnostic tool: PID/DATA Record and Monitor. • While opening and closing the luggage compartment lid, monitor the REM PID DECKLID. • **Do the REM PID values agree with the luggage compartment lid positions?**	**Yes** GO to E3 . **No** GO to E4 .
E3 CHECK CIRCUIT 31S-LB25 (BK/BU) FOR SHORT TO GROUND	
• Key in OFF position. • Disconnect: REM C420a. • Disconnect: Luggage Compartment Lid Lamp C428. • Measure the resistance between the REM, C420a-11, circuit 31S-LB25 (BK/BU), harness side and ground.  A0065591 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to E7 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
E4 CHECK THE LUGGAGE COMPARTMENT LID AJAR SWITCH	
• Disconnect: Luggage Compartment Lid Ajar Switch C429. • Connect a fused (10A) jumper wire between the luggage compartment lid ajar switch C429-1, circuit 8-GL20 (WH/BK) and C429-2, circuit 31-GL20 (BK/RD) harness side.  A0062632 • **Does the luggage compartment lid lamp go OFF?**	**Yes** INSTALL a new luggage compartment lid ajar switch. REFER to Section 419-01 . CLEAR the DTCs. REPEAT the self-test. **No** GO to E5 .

E5 CHECK CIRCUIT 31-GL20 (BK/RD) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the luggage compartment lid ajar switch, C429-2, circuit 31-GL20 (BK/RD), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** GO to E6 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
E6 CHECK CIRCUIT 8-GL20 (WH/BK) FOR AN OPEN	
• Disconnect: REM C420b. • Measure the resistance between the REM, C420b-14, circuit 8-GL20 (WH/BK) , harness side and luggage compartment lid ajar switch, C429-1, circuit 8-GL20 (WH/BK), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to E7 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
E7 CHECK FOR CORRECT REM OPERATION	

• Disconnect all REM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all REM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new REM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: The Luggage Compartment Lamp is Inoperative

Normal Operation

The luggage compartment lamp is controlled through the REM. SSP relay 4 supplies power to the lamp through circuit 29S-LB4 (OG/BK). The luggage compartment lid ajar switch provides a ground signal to the REM through circuit 8-GL20 (WH/BK) which, in turn, provides a ground signal to the luggage compartment lamp through circuit 31S-LB25 (BK/BU).

Possible Causes

- luggage compartment lid ajar switch
- battery junction box (BJB) fuse 4 (10A)
- BJB
- REM
- circuit 29S-LB25 (OG/BU) open
- circuit 31S-LB25 (BK/BU) open
- circuit 31S-LB25 (BK/BU) short to ground
- 8-GL20 (WH/BK) short to ground

PINPOINT TEST F: THE LUGGAGE COMPARTMENT LAMP IS INOPERATIVE

Test Step	Result / Action to Take
F1 RETRIEVE REM DIAGNOSTIC TROUBLE CODES	
• Use recorded results from REM self-test. • **Are any REM DTCs recorded?**	**Yes** REFER to REM Diagnostic Trouble Code (DTC) Index. **No** GO to F2 .
F2 CHECK THE LUGGAGE COMPARTMENT LID AJAR SWITCH INPUT TO THE REM	
NOTE: The ignition switch must be cycled from OFF to ON to enable the switched system power feature. The switched system power will remain active for one half-hour after ignition is turned OFF. Refer to Principles of Operation for switched system power operation. • Connect the diagnostic tool. • Enter the following diagnostic mode on the diagnostic tool: PID/DATA Record and Monitor. • While opening and closing the luggage compartment lid, monitor the REM PID DECKLID. • **Does the REM PID values DECKLID agree with the luggage compartment lid position?**	**Yes** GO to F3 . **No** GO to F8 .
F3 CHECK POWER TO THE BJB FUSE 4 (10A)	
• Disconnect: BJB fuse 4 (10A) • Key in ON position. • Measure the voltage between the BJB fuse 4 (10A) input side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** INSTALL BJB fuse 4 (10A) andGO to F4 . **No** REPAIR supply circuit to the BJB. CLEAR the DTCs. REPEAT the self-test.
F4 CHECK CIRCUIT 29S-LB25 (OG/BU) FOR AN OPEN	

• Disconnect: Luggage Compartment Lid Lamp C428. • Measure the voltage between luggage compartment lid lamp, C428-1, circuit 29S-LB25 (OG/BU), harness side and ground.  A0062612 • **Is the voltage greater than 10 volts?**	**Yes** GO to F5 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
F5 CHECK CIRCUIT 31S-LB25 (BK/BU) FOR VOLTAGE	
• Measure the voltage between luggage compartment lid lamp, C428-2, circuit 31S-LB25 (BK/BU), harness side and ground.  A0062614 • **Is the voltage greater than 10 volts?**	**Yes** GO to F7 . **No** GO to F6 .
F6 CHECK CIRCUIT 31S-LB25 (BK/BU) FOR AN OPEN	
• Key in OFF position. • Disconnect: REM C420a. • Measure the resistance between the REM, C420a-11, circuit 31S-LB25 (BK/BU), harness side and luggage compartment lid lamp, C428-2, circuit 31S-LB25 (BK/BU), harness side.  A0062613 • **Is the resistance less than 5 ohms?**	**Yes** GO to F10 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
F7 CHECK CIRCUIT 31S-LB25 (BK/BU) FOR SHORT TO BATTERY	
• Key in OFF position. • Disconnect: REM C420b. • Key in ON position. • Measure the voltage between the luggage compartment lid lamp, C428-2, circuit 31S-LB25 (BK/BU) harness side and ground.	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to F10 .

 A0062614 • **Is the voltage greater than 10 volts?**	
F8 CHECK FOR A STUCK OR STICKING LUGGAGE COMPARTMENT AJAR SWITCH	
• Key in ON position. • Disconnect: Luggage Compartment Lid Ajar Switch C429. • While disconnecting the luggage compartment lid ajar switch observe luggage compartment lamp. • **Does the luggage compartment lid lamp go ON?**	**Yes** INSTALL a new luggage compartment lid ajar switch. REFER to Section 419-01 . TEST the system for normal operation. **No** GO to F9 .
F9 CHECK CIRCUIT 8-GL20 (WH/BK) FOR SHORT TO GROUND	
• Key in OFF position. • Disconnect: REM C420b. • Measure resistance between the luggage compartment lid ajar switch, C429-1, circuit 8-GL20 (WH/BK), harness side and ground.  A0062629 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to F10 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
F10 CHECK FOR CORRECT REM OPERATION	

• Disconnect all REM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all REM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new REM. REFER to Section 418-00 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

4-Wheel Anti-Lock Brake/Traction Control (ABS/TC) Control Module Or Stability Assist Module (if equipped)

The anti-lock brake system/traction (ABS/TC) control module or stability assist module (if equipped) are on the standard corporate protocol (SCP) communication network. The ABS/TC control module or stability assist module controls the brake pressure to the four wheels to keep the vehicle under control while braking. For additional information, refer to Section 206-09 .

Front Electronic Module (FEM)/Rear Electronic Module (REM)

The front electronic module (FEM) and rear electronic module (REM) are connected to the SCP communication network. The FEM and the REM control both interior and exterior lighting and active anti-theft functions. For additional information on interior lamps, refer to Section 417-02 . For additional information on exterior lighting, refer to Section 417-01 . For additional information on active anti-theft, Section 419-01 .

Restraint Control Module (RCM)

The restraint control module (RCM) is on the international standards organization (ISO) 9141 network. The RCM controls the deployment of the air bags based on sensor input. For additional information, refer to Section 501-20B .

Instrument Cluster

The instrument cluster is on the SCP communication network. It is an analog face cluster with a digital odometer. The instrument cluster displays a variety of information. For additional information, refer to Section 413-00 .

Powertrain Control Module (PCM)

The powertrain control module (PCM) is on the controller area network (CAN) communication network. The PCM controls the engine for better fuel economy, emissions control, failure mode detection and storage. Refer to Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.

Dual Automatic Temperature Control (DATC) Module

The dual automatic temperature control (DATC) module is on the SCP communication network. The DATC module controls automatic climate functions that maintain the vehicle interior temperature at a constant setting. For additional information, refer to Section 412-00 .

Audio Control Module (ACM)

The audio control module (ACM) is connected to the SCP communication network and also to the audio control protocol (ACP) communication network. The ACM communicates with the compact disc player/changer using the ACP. The ACM uses the SCP network for diagnostics. For additional information on the ACM and the compact disc player/changer, refer to Section 415-00 .

Navigation System Module

The navigation system module is on the SCP communication network. The vehicle navigation system provides a feature that will guide the user to any entered destination. The system uses the global positioning sensor (GPS), vehicle speed, and other sensor information to accurately establish the vehicle position. The

navigation system module compares this position to the CD-ROM vector map. The system then provides the maneuvers required during the journey in order to arrive at the destination entered. For additional information, refer to Section 419-02 .

Driver Seat Module (DSM)

The driver seat module (DSM) is on the SCP communication network. The DSM controls the positioning and programming of the driver seat. For additional information, refer to Section 501-10 .

Driver Climate Control Seat Module

The driver climate control seat module is on the universal asynchronous transmitter-receiver (UART)-based protocol UBP communications network. The driver climate control seat module controls the heating and cooling elements in the seat for passenger comfort. For additional driver climate control seat module information, refer to Section 501-10 .

Passenger Climate Control Seat Module

The passenger climate control seat module is on the UBP communications network. The passenger climate control seat module controls the heating and cooling elements in the seat for passenger comfort. For additional passenger climate control seat module information, refer to Section 501-10 .

Parking Aid Module

The parking aid module is connected to the UBP communications network. The module controls sensors in the rear bumper that detect close objects when the transmission is in REVERSE. For additional information, refer to Section 413-00 .

Electric Parking Brake Module

The electric parking brake module is connected to the SCP communication network. The module controls the solenoid which applies and releases the parking brake. For additional electric parking brake module information, refer to Section 206-00 .

Driver Door Module (DDM)

The driver door module (DDM) is connected to the SCP communication network. The DDM accepts the user memory set and recall buttons. The DDM then sends the memory set and recall commands to the other modules over the SCP bus. The DDM also controls the driver mirror (memory positions are stored there and manual functions are controlled there). The DSM controls the driver seat. The FEM control the passenger mirror and adjustable pedals positions. The instrument cluster controls the steering column positions. For additional information, refer to Section 501-14 .

Principles of Operation

The vehicle has four module communication networks: the controller area network (CAN) communications network, the standard corporate protocol (SCP), which is an unshielded twisted pair cable data bus plus and data bus minus, the universal asynchronous receiver-transmitter (UART)-based protocol (UBP) communications network, a single wire network and the international standards organization (ISO) 9141 communications network, which is a single wire network. All four networks are connected to the data link connector (DLC). This makes diagnosis and testing of these systems easier by allowing one smart tester to be able to diagnose and control any module on the two networks from one connector. The DLC can be found under the instrument panel between the steering column and the radio.

The CAN communications network is a high speed communication network used for powertrain communication. The CAN communication network will remain operational even with the severing of one of the bus wires. Communications will also continue if one of the bus wires is shorted to ground or voltage, or if some but not all termination resistors are lost.

The SCP communications network will remain operational even with the severing of one of the bus wires. Communications will also continue if one of the bus wires is shorted to ground or voltage, or if some but not all termination resistors are lost.

The ISO 9141 communications network does not permit intermodule communication. When the diagnostic tool communicates to modules on the ISO 9141 communication network, the diagnostic tool must ask for all information; the modules cannot initiate communications. The ISO 9141 communications network will not function if the wire is shorted to ground or battery voltage. Also, if one of the modules on the ISO 9141 communications network loses power or shorts internally, communications to that module will fail.

The UBP communications network will not function if the wire is shorted to ground or voltage. The UBP is different from the ISO communication network in that it allows intermodule communication.

Module Configuration Printable View (12 KB)

Principles of Operation

Some modules must be programmed as part of the repair procedure. If this procedure is not followed the module will not function correctly and may set a number of DTCs, including B2477 or P1639, which indicate that some necessary data has not been programmed into the module.

Modules that need programming should not be exchanged between vehicles. In most cases the parameter values or settings are unique to that vehicle, and if not set correctly will cause concerns or faults.

Some programmable parameters, such as belt minder on/off, can be changed from the factory setting at the customer's request.

Worldwide Diagnostic System (WDS) will automatically attempt to retrieve the module configuration information from all modules when vehicle ID is carried out. If the module does not contain correct information, the diagnostic tool will either request "As-Built" data or display a list of items that will need to be manually configured. The diagnostic tool will program the module based on the data entered.

There are three different methods that are used for module programming:

- programmable module installation
- calibration update
- programmable parameters

Some modules do not support all three methods.

Programmable Module Installation (PMI)

The programmable module installation (PMI) method is used when a new programmable module is installed on the vehicle. It is no longer necessary to command the diagnostic tool to gather module option content from the old module. The diagnostic tool automatically obtains any available module option content information from the old module during the vehicle ID routine that runs when the diagnostic tool is initially connected to the vehicle. It is important that you connect WDS to the vehicle and allow it to identify the vehicle and obtain configuration data prior to removing any modules.

Calibration Update

Calibration update is used to install a new calibration and strategy into a module. The updates are usually issued to fix a concern in the module software and would normally be addressed by a technical service bulletin (TSB). This method has been used by the PCM for several years. Other modules will be adopting this strategy as well.

Programmable Parameters

This method is used to configure parameters that can be modified in service. These are typically at the preference of the customer. Not all features controlled by the module are listed in this configuration method. Refer to the Module Controlled Functions in this section for a list of features by system.

If a module that has been modified using programmable parameters needs to be installed, the PMI procedure will maintain the parameters in their altered state if the WDS is able to communicate with the old module

during Vehicle ID. Otherwise you may need to use programmable parameters to return them to the altered state.

Vehicle Identification (VID) Block

Some PCMs contain a memory area called a vehicle identification (VID) block. The VID block is used to store backup data for the powertrain configuration information only.

As-Built Data Center

The As-Built Data Center maintains a record of the vehicle configuration in a database. The vehicle VIN is required to obtain this information. The As-Built Data Center records the applicable module configurations stored in each module before the vehicle leaves the factory. The As-Built Data Center will always reflect the original build of the vehicle as it left the factory. Only contact the As-Built Data Center when directed to do so by the diagnostic tool.

Inspection and Verification

1. Visually inspect for obvious signs of electrical damage. Refer to the following chart:

   Visual Inspection Chart

Electrical
• Wiring harness • Connectors

Configurable Modules

The vehicle contains the following modules that are configurable:

- anti-lock brake/traction control (ABS/TC) or stability assist module (if equipped)
- dual automatic temperature control (DATC)
- driver door module (DDM)
- driver climate control seat module
- passenger climate control seat module
- instrument cluster
- front electronics module (FEM)
- message center
- rear electronics module (REM)
- navigation system module
- audio control module (ACM)
- electronic parking brake

Programmable Parameters Index

System	Programmable Parameter Items
Warnings and chimes	Belt minder
Security	

	• Two-stage unlock • Easy entry/exit • Horn chirp • Auto-locks
Message center	• Default oil life warning threshold

Module Controlled Functions

Printable View (10 KB)

The multifunction modules consist of the following:

- front electronic module (FEM)
- rear electronic module (REM)
- driver door module (DDM)
- driver seat module (DSM)

Principles of Operation

Front Electronic Module (FEM), Rear Electronic Module (REM)

The front electronic module (FEM) and rear electronic module (REM) control adjustable pedals, RH exterior mirror, interior and exterior lighting and active anti-theft functions. For additional information on interior lamps, refer to Section 417-02 . For additional information on exterior lighting, refer to Section 417-01 . For additional information on active anti-theft, refer to Section 419-01 . For additional information on exterior mirrors, refer to Section 501-00 .

Driver Door Module (DDM)

The driver door module controls many functions including the keyless entry keypad, power locks, and remote keyless entry. The DDM also communicates with the driver seat module (DSM) to control power seat and mirror memory. For additional information, refer to Section Section 501-14 . For additional information on the LH exterior mirror, refer to Section 501-00 .

Driver Seat Module (DSM)

The DSM allows automatic positioning of the memory driver seat two programmable positions. For additional information, refer to Section 501-10 .

Diagnostic Trouble Code Chart

B1327	Passenger Door Ajar Circuit Failure	FEM	REFER to Section 417-02 .
B1331	Decklid Ajar Rear Door Circuit Failure	REM	REFER to Section 417-02 .
B1341	Power Door Unlock Circuit Short to Ground	DDM	REFER to Section 501-14 .
B1342	ECU is Defective	Parking Aid Module	CLEAR the DTC. REPEAT the parking aid module self-test. If DTC B1342 is retrieved again, INSTALL a new parking aid module. REFER to Section 413-00 . CLEAR the DTCs. REPEAT the self-test.
B1342	ECU is Defective	FEM	CLEAR the DTC. REPEAT the FEM self-test. If DTC B1342 is retrieved again, INSTALL a new FEM. REFER to Front Electronic Module (FEM) in this section. CLEAR the DTCs. REPEAT the self-test.
B1342	ECU is Defective	DATC	CLEAR the DTC. REPEAT the DATC module self-test. If DTC B1342 is retrieved again, INSTALL a new DATC module. REFER to Section 412-00 . CLEAR the DTCs. REPEAT the self-test.
B1342	ECU is Defective	Climate Control Seat Module	CLEAR the DTC. REPEAT the climate control seat module self-test. If DTC B1342 is retrieved again, INSTALL a new climate control seat module. REFER to Section 501-10 . CLEAR the DTCs. REPEAT the self-test.
B1342	ECU is Defective	Instrument Cluster	CLEAR the DTC. REPEAT the instrument cluster self-test. If DTC B1342 is retrieved again, INSTALL a new instrument cluster. REFER to Section 413-00 . CLEAR the DTCs. REPEAT the self-test.
B1342	ECU is Defective	DSM	REPEAT the DSM self-test. If DTC B1342 is retrieved again, INSTALL a new DSM. REFER to Driver Seat Module (DSM) in this section. CLEAR the DTCs. REPEAT the self test.
B1342	ECU is Defective	DDM	CLEAR the DTC. REPEAT the DDM self-test. If DTC B1342 is retrieved again, INSTALL a new

			DDM. REFER to Driver Door Module (DDM) in this section. CLEAR the DTCs. REPEAT the self-test.
B1342	ECU is Defective	REM	CLEAR the DTC. REPEAT the REM self-test. If DTC B1342 is retrieved again, INSTALL a new REM. REFER to Rear Electronic Module (REM) in this section. CLEAR the DTCs. REPEAT the self-test.
B1342	ECU is Defective	RCM.	CLEAR the DTC. REPEAT the RCM self-test. If DTC B1342 is retrieved again, INSTALL a new RCM. REFER to Section 501-20B . CLEAR the DTCs. REPEAT the self-test.
B1342	ECU is Defective	ABS/TC Module or Stability Assist Module	CLEAR the DTC. REPEAT the ABS/TC module self-test. If DTC B1342 is retrieved again, INSTALL a new ABS/TC module. REFER to Section 206-09 . CLEAR the DTCs. REPEAT the self-test.
B1342	ECU Defective	Message Center	**NOTE:** The message center is part of the instrument cluster. CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new instrument cluster. REFER to Section 413-00 . CLEAR the DTCs. REPEAT the self-test.
B1342	ECU is Defective	Navigation System Module	CLEAR the DTCs. RETRIEVE the DTCs. If DTC B1342 is retrieved again, INSTALL a new navigation system module. REFER to Section 419-02 . CLEAR the DTCs. REPEAT the self-test.
B1342	ECU is Defective	ACM	CLEAR the DTCs. CARRY OUT the ACM On-Demand Self-Test. REMOVE the ACM, REFER to Section 415-00 and SEND it to an authorized Ford audio system repair facility if DTC B1342 is retrieved again. TEST the system for normal operation.
B1342	ECU is Defective	Electronic Parking Brake Module	CLEAR the DTCs. RETRIEVE the DTCs. If DTC B1342 is retrieved again, INSTALL a new electronic parking brake module. REFER to Section 206-00 . CLEAR the DTCs. REPEAT the self-test.
B1352	Ignition Key-in Circuit Failure	Instrument Cluster	REFER to Section 413-00 .
B1358	Ignition Switch or Blower Electronics Circuit Short to Ground	Climate Control Seat Module	REFER to Section 501-10 .
B1416	Power Window LR Motor Circuit Short to Battery	DDM	REFER to Section 501-00 .
B1424	Power Window RR Switch Circuit Short to Battery	DDM	REFER to Section 501-00 .

Communications Network Printable View (1024 KB)

Refer to Wiring Diagrams Cell 14 for schematic and connector information.

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2332-A	Worldwide Diagnostic System (WDS) 418-F224 New Generation STAR (NGS) Tester 418-F052 or equivalent diagnostic tool with appropiate adapter cable

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of electrical damage.

Visual Inspection Chart

Electrical
• Central junction box (CJB) fuse 6 (10A) • Wiring harness • Loose or corroded connections

3. If the cause is not visually evident, connect the diagnostic tool to the data link connector and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
   - check that the program card is correctly installed.
   - check the connections to the vehicle.
   - check the ignition switch position.

If the diagnostic tool still does not communicate with the vehicle, Go To Pinpoint Test T .

4. Go To Pinpoint Test PC .

System Precheck

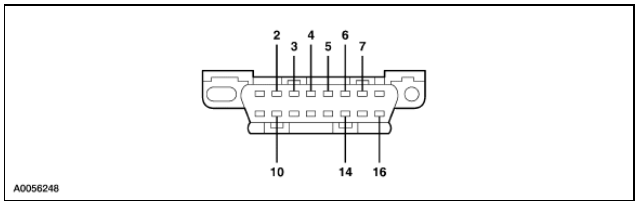
PINPOINT TEST PC: DATA LINK DIAGNOSTICS NETWORK TEST

Test Step	Result / Action to Take
PC1 RUN THE DATA LINK DIAGNOSTICS NETWORK TEST	
• Carry out the data link diagnostics test. • **Is system passed obtained?**	**Yes** Test passed. RETURN to the Symptom Chart of the section for the module in question. **No** If no response from the diagnostic tool, Go To Pinpoint Test T . If ISO, SCP+ and/or SCP- = SOME ECUS NO RESP/NOT EQUIP, REFER to the Symptom Chart. If ISO = ALL ECUS NO RESP/NOT EQUIP, Go To Pinpoint Test P . If SCP+ = ALL ECUS NO RESP/NOT EQUIP, Go To Pinpoint Test O . If SCP- = ALL ECUS NO RESP/NOT EQUIP, Go To Pinpoint Test O . If the module in question is NO RESPONSE/NOT EQUIPPED, REFER to the Symptom Chart. If the module in question is NO RESPONSE ON SCP+, REFER to the Symptom Chart. If the module in question is NO RESPONSE ON SCP-, REFER to the Symptom Chart.

Symptom Chart

Symptom Chart
Connector Circuit Reference

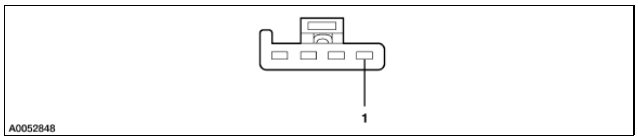
Data Link Connector (DLC) C251



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
2		

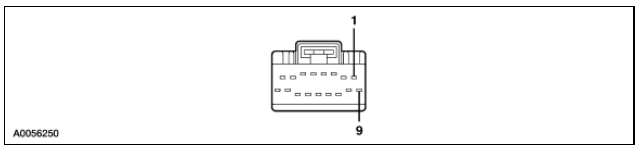
	4-EG7 (GY/RD) SCP communications circuit.	Less than 5 ohms between the DLC and the module in concern disconnected. Greater than 10,000 ohms between the DLC and ground with all network modules disconnected.
3	4-ED6 (GY) UBP communications circuit.	Less than 5 ohms between the DLC and the module in concern disconnected. Greater than 10,000 ohms between the DLC and ground.
4	31-ED6 (BK) ground.	Less than 5 ohms to ground.
5	91-ED6 (BN) ground.	Less than 5 ohms to ground.
6	4-EC7 (GY/RD) CAN communication circuit.	Less than 5 ohms between the DLC and the module in concern disconnected. Greater than 10,000 ohms to ground with all network modules disconnected.
7	4-EE10 (GY/BK) ISO 9141 communication circuit.	Less than 5 ohms between the DLC and the module in concern disconnected. Greater than 10,000 ohms to ground with all network modules disconnected.
10	5-EG7 (BU/RD) SCP communication circuit.	Less than 5 ohms between the DLC and the module in concern disconnected. Greater than 10,000 ohms to ground with all network modules disconnected.
14	5-EC7 (BU/RD) CAN communication circuit.	Less than 5 ohms between the DLC and the module in concern disconnected. Greater than 10,000 ohms to ground with all network modules disconnected.
16	29-ED6 (OG/YE) B+ power feed in RUN position.	10 volts or greater with the key ON. Greater than 10,000 ohms to ground.

Climate Control Seat Module Driver C3031a, Passenger C3036a



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1 (C3031a)	4-HC21 (GY/OG) UBP communication circuit.	Less than 5 ohms between the DLC and the driver climate control seat module. Greater than 10,000 ohms to ground with all network modules disconnected.
1 (C3036a)	4-HC22 (GY) UBP communication circuit.	Less than 5 ohms between the DLC and the passenger climate control seat module. Greater than 10,000 ohms to ground with all network modules disconnected.

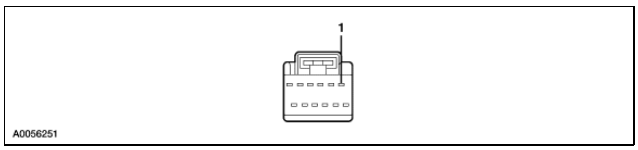
Driver Seat Module (DSM) C341c



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement

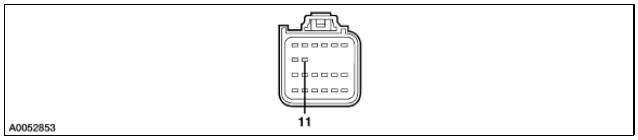
1	4-AH80 (GY/WH) SCP communication circuit.	Less than 5 ohms between the DLC and the DSM. Greater than 10,000 ohms to ground with all network modules disconnected.
9	5-AH80 (BU/OG) SCP communication circuit.	Less than 5 ohms between the DLC and the DSM. Greater than 10,000 ohms to ground with all network modules disconnected.

Parking Aid Module C4014b



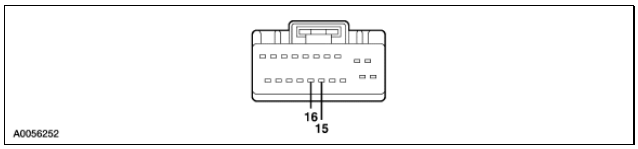
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	4-GN10 (GY) UBP communication circuit.	Less than 5 ohms between the DLC and the parking aid module. Greater than 10,000 ohms to ground with all network modules disconnected.

Restraint Control Module (RCM) C310a



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
11	4-EE1 (GY/RD) ISO 9141 communication circuit.	Less than 5 ohms between the DLC and the RCM. Greater than 10,000 ohms to ground with all network modules disconnected.

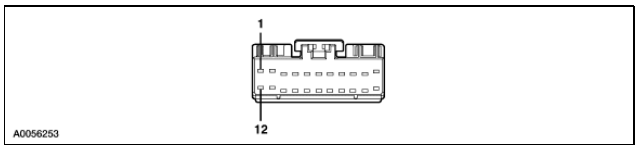
Instrument Cluster C220b



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
15	4-EG8 (GY/VT) SCP communication circuit	Less than 5 ohms between the instrument cluster and the DLC. Greater than 10,000 ohms to ground with all network modules disconnected.
16	5-EG8 (BU/WH) SCP communication circuit	Less than 5 ohms between the instrument cluster and the DLC. Greater than 10,000 ohms to ground with all network

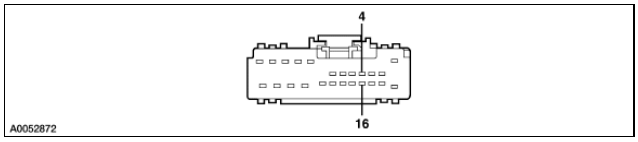
		modules disconnected.

Dual Automatic Temperature Control (DATC) C228a



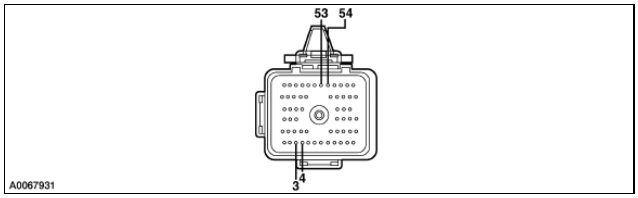
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	5-FA10 (BU/YE) SCP communication circuit	Less than 5 ohms between the DATC and the DLC. Greater than 10,000 ohms to ground with all network modules disconnected.
12	4-FA10 (GY/BK) SCP communication circuit	Less than 5 ohms between the DATC and the DLC. Greater than 10,000 ohms to ground with all network modules disconnected.

Navigation System Module C4209



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
4	4-EG17 (GY/BK) SCP communication circuit	Less than 5 ohms between the navigation system module and the DLC. Greater than 10,000 ohms to ground with all network modules disconnected.
16	5-EG17 (BU/YE) SCP communication circuit	Less than 5 ohms between the navigation system module and the DLC. Greater than 10,000 ohms to ground with all network modules disconnected.

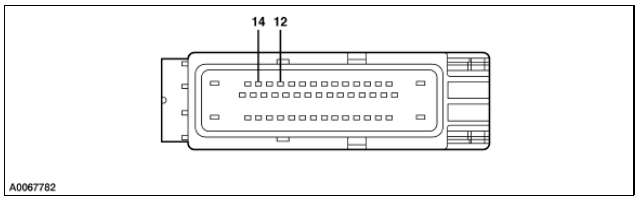
Powertrain Control Module (PCM) C175a



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
3	4-RE8 (GY) SCP communication circuit	Less than 5 ohms between the PCM and the DLC. Greater than 10,000 ohms to ground with all network modules disconnected.

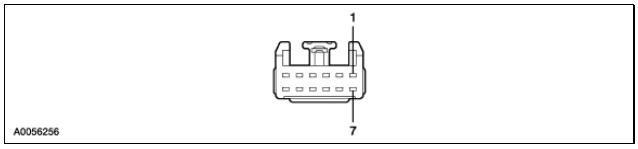
4	5-RE8 (BU) SCP communication circuit	Less than 5 ohms between the PCM and the DLC. Greater than 10,000 ohms to ground with all network modules disconnected.
53	4-EC7 (GY/RD) SCP communication circuit	Less than 5 ohms between the PCM and the DLC. Greater than 10,000 ohms to ground with all network modules disconnected.
54	5-EC-7 (BU/RD) SCP communication circuit	Less than 5 ohms between the PCM and the DLC. Greater than 10,000 ohms to ground with all network modules disconnected.

Anti-Lock Brake System/Traction Control (ABS/TC) Module C135 or Stability Assist Module C155



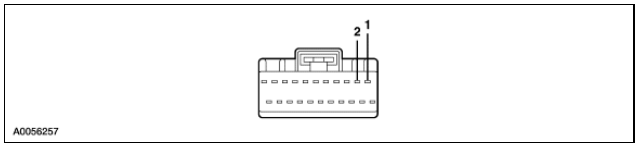
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
12	4-CF6 (GY) SCP communication circuit	Less than 5 ohms between the ABS/TC module or stability assist module, and the DLC. Greater than 10,000 ohms to ground with all network modules disconnected.
14	5-CF6 (BU) SCP communication circuit	Less than 5 ohms between the ABS/TC module or stability assist module, and the DLC. Greater than 10,000 ohms to ground with all network modules disconnected.

Electronic Parking Brake Module C4205b



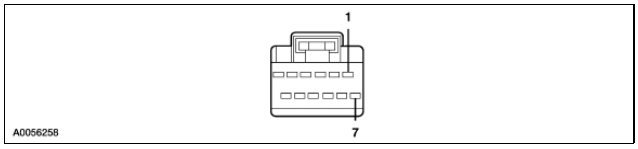
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	4-CG16 (GY/RD) SCP communication circuit.	Less than 5 ohms between the electronic parking brake module and the DLC. Greater than 10,000 ohms to ground with all network modules disconnected.
7	5-CG16 (BU/RD) SCP communication circuit.	Less than 5 ohms between the electronic parking brake module and the DLC. Greater than 10,000 ohms to ground with all network modules disconnected.

Rear Electronic Module (REM) C420b



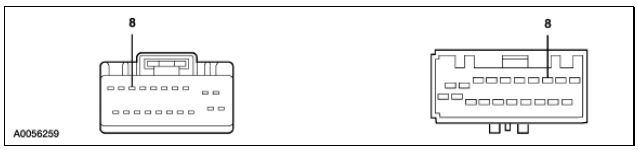
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	4-EG12 (GY/WH) SCP communication circuit.	Less than 5 ohms between the REM and the DLC. Greater than 10,000 ohms to ground with all network modules disconnected.
2	5-EG12 (BU/OG) SCP communication circuit.	Less than 5 ohms between the REM and the DLC. Greater than 10,000 ohms to ground with all network modules disconnected.

Front Electronic Module (FEM) C201c



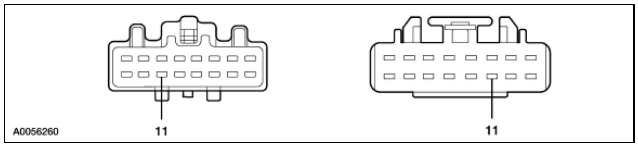
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	5-EG11 (BU) SCP communication circuit.	Less than 5 ohms between the FEM and the DLC. Greater than 10,000 ohms to ground with all network modules disconnected.
7	4-EG11 (GY) SCP communication circuit.	Less than 5 ohms between the FEM and the DLC. Greater than 10,000 ohms to ground with all network modules disconnected.

In-line C212M,C212F



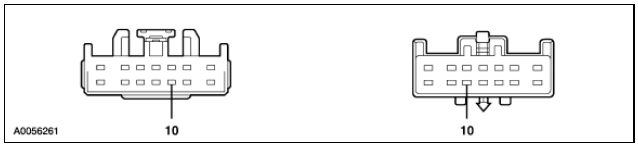
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
8	4-EE10 (GY/BK) ISO 9141 communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network moduels disconnected.

In-line C213M, C213F



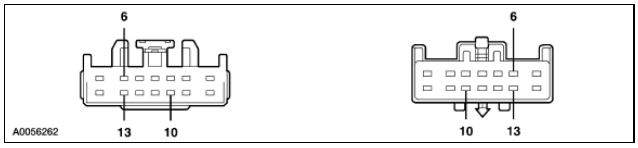
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
11	4-HC1 (GY/RD) UBP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.

In-line C313M, C313F



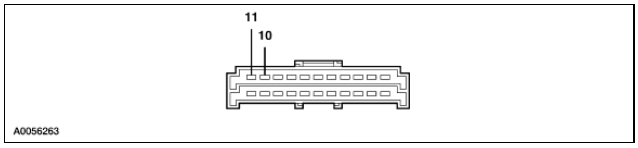
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
10	4-HC22 (GY) UBP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.

In-line C315M, C315F



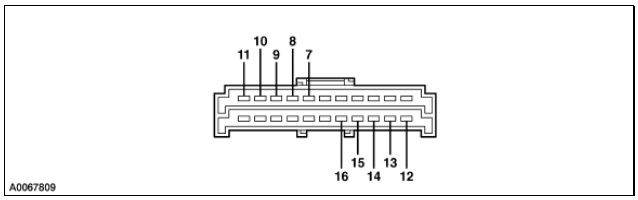
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
6	4-AH80 (GY/WH) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
10	4-HC21 (GY/OG) UBP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
13	5-AH80 (BU/OG) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.

Joint Connector No. 1 C261



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
10	4-ED6 (GY) UBP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
11	4-HC1 (GY/RD) UBP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.

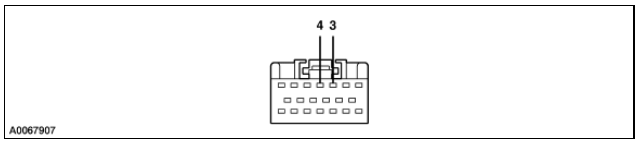
Joint Connector No. 4 C223



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
7	5-EG10 (BU/YE) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
8	5-FA10 (BU/YE) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
9	5-EG7 (BU/RD) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
10	5-EG8 (BU/WH) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
11	5-EG1 (BU/RD) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
12	4-EG1 (GY/RD) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
13	4-EG8 (GY/VT) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
14	4-EG7 (GY/RD) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with

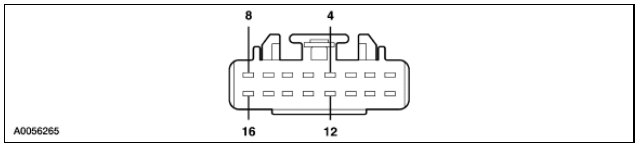
		all network modules disconnected.
15	4-FA10 (GY/BK) SCP communication circuit	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
16	4-EG10 (GY/BK) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.

Audio Control Module (ACM) C240c



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
3	4-EG10 (GY/BK) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
4	5-EG10 (BU/YE) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.

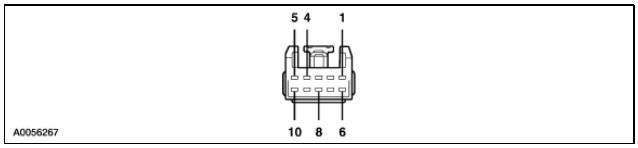
Interior Auxiliary Junction Box (AJB) C283a, C283b



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
4 (C283a)	5-EG13 (BU/BK) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
4 (C283b)	5-CG16 (BU/RD) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
8 (C283a)	4-EG13 (GY/OG) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected with all network modules disconnected.
8 (C283b)	4-EG1 (GY/RD) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network

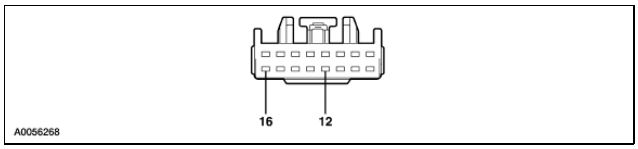
		modules disconnected.
12 (C283a)	5-AH80 (BU/OG) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
12 (C283b)	5-EG12 (BU/OG) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
16 (C283a)	4-AH80 (GY/WH) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
16 (C283b)	4-EG12 (GY/WH) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.

Interior Auxiliary Junction Box (AJB) C283c



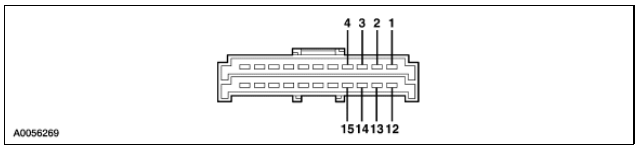
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	5-RE8 (BU) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
4	4-RE8 (GY) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
5	4-CF6 (GY) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
6	5-CF6 (BU) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
8	5-EG11 (BU) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
10	4-EG11 (GY) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.

Interior Auxiliary Junction Box (AJB) C283d



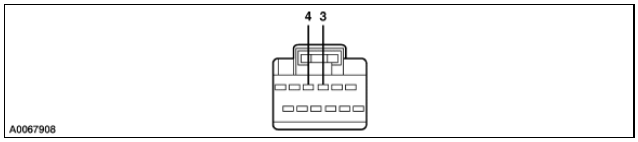
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
12	5-EG1 (BU/RD) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
16	Circuit 4-EG1 (GY/RD) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.

Joint Connector No. 5 C427



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	4-EG1 (GY/RD) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
2	4-CG16 (GY/RD) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
4	4-EG17 (GY/BK) SCP communication circuit	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
12	5-EG1 (BU/RD) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
13	5-CG16 (BU/RD) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.
15	5-EG17 (BU/YE) SCP communication circuit.	Less than 5 ohms between the module connector, DLC or in-line connector. Greater than 10,000 ohms to ground with all network modules disconnected.

Driver Door Module (DDM) C501a



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
3	4-EG13 (GY/OG) SCP communication circuit.	Less than 5 ohms between the driver door module and the DLC. Greater than 10,000 ohms to ground with all network modules disconnected
4	5-EG13 (BU/BK) SCP communication circuit.	Less than 5 ohms between the driver door module and the DLC. Greater than 10,000 ohms to ground with all network modules disconnected.

Pinpoint Test A: The Anti-Lock Brake/Traction Control (ABS/TC) Module Or Stability Assist Module Does Not Respond To The Diagnostic Tool

Refer to Wiring Diagrams Cell 14 for schematic and connector information.

Normal Operation

The ABS/TC module or stability assist module communicates with the diagnostic tool through the SCP communications network circuits 4-CF6 (GY) and 5-CF6 (BU). If one of the bus wires becomes shorted to ground or voltage, or if some but not all termination resistors are lost communications can continue. Check circuits 4-CF6 (GY) and 5-CF6 (BU) between the ABS/TC C135 or stability assist module C155 and the DLC C251. Total resistance values must not be more than 5 ohms. If the resistance is more than 5 ohms there is an open in circuit 4-CF6 (GY) or 5-CF6 (BU), damage to the DLC C251, damage to the ABS/TC C135 or stability assist module C155, a problem in the in-line auxiliary junction box (AJB) C283c, C283d or joint connector No. 4 C223.

Possible Causes

- circuits 4-CF6 (GY) and/or 5-CF6 (BU) shorted to ground or open
- C155, C135
- interior AJB C283c, C283d
- joint connector No. 4 C223
- DLC C251
- ABS/TC module or stability assist module

PINPOINT TEST A: THE ANTI-LOCK BRAKE/TRACTION CONTROL (ABS/TC) MODULE OR STABILITY ASSIST MODULE DOES NOT RESPOND TO THE DIAGNOSTIC TOOL

Test Step	Result / Action to Take
A1 CHECK THE ABS/TC OR STABILITY ASSIST CONTROL MODULE FOR DAMAGE	
• Key in OFF position. • Disconnect: the ABS/TC control module C135, or the stability assist module C155.	**Yes** GO to A2 . **No** REPAIR the ABS/TC module

• Inspect the ABS/TC control module C135 or stability assist module C155 for damage. • **Is the ABS/TC C135 or stability assist module C155 ok?**	C135 or stability assist module C155 as necessary. TEST the system for normal operation.
A2 CHECK FOR AN OPEN BETWEEN THE DLC C251 AND THE ABS/TC MODULE C135 OR STABILITY ASSIST MODULE C155	
• If equipped with an ABS/TC module, measure the resistance between the ABS/TC module C135-12, circuit 4-CF6 (GY), harness side and the DLC C251-2, circuit 4-EG7 (GY/RD), harness side. If equipped with a stability assist module, measure the resistance between the stability assist module C155-12, circuit 4-CF6 (GY), harness side and the DLC C251-2, circuit 4-EG7 (GY/RD), harness side.  A0067783 • If equipped with an ABS/TC module, measure the resistance between the ABS/TC module C135-14, circuit 5-CF6 (BU), harness side and the C251-10, circuit 5-EG7 (BU/RD), harness side. If equipped with a stability assist module, measure the resistance between the stability assist module C155-14, circuit 5-CF6 (BU), harness side and the C251-10, circuit 5-EG7 (BU/RD), harness side.  A0067784 • **Are the resistances less than 5 ohms?**	**Yes** GO to A7 . **No** GO to A3 .
A3 CHECK FOR AN OPEN BETWEEN THE INTERIOR AUXILLARY JUNCTION BOX (AJB) C283c AND ABS/TC C135 OR STABILITY ASSIST MODULE C155	
• Disconnect: Interior AJB C283c. • If equipped with an ABS/TC module, measure the resistance between the ABS/TC module C135-12, circuit 4-CF6 (GY), harness side and the interior AJB C283c-5, circuit 4-CF6 (GY), harness side. If equipped with a stability assist module, measure the resistance between the stability assist module C155-12, circuit 4-CF6 (GY), harness side and the interior AJB C283c-5, circuit 4-CF6 (GY), harness side.	**Yes** GO to A4 . **No** REPAIR the circuit in question. CARRY OUT the diagnostic tool data link test.

 A0067785 • If equipped with an ABS/TC module, measure the resistance between the ABS/TC module C135-14, circuit 5-CF6 (BU), harness side and the interior AJB C283c-6, circuit 5-CF6 (BU), harness side. If equipped with a stability assist module, measure the resistance between the stability assist module C155-14, circuit 5-CF6 (BU), harness side and the interior AJB C283c-6, circuit 5-CF6 (BU), harness side.  A0067786 • **Are the resistances less than 5 ohms?**	
A4 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283c AND THE INTERIOR AJB C283d	
• Disconnect: Interior AJB C283d. • Measure the resistance between the interior AJB C283d-16, component side and the interior AJB C283c-5, component side.  A0004355 • Measure the resistance between the interior AJB C283d-12, component side and the interior AJB C283c-6, component side.  A0004360 • **Are the resistances less than 5 ohms?**	**Yes** GO to A5 . **No** INSTALL a new interior AJB. TEST the system for normal operation.
A5 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283d AND JOINT CONNECTOR No. 4 C223	
• Disconnect: Joint Connector No. 4 C223. • Measure the resistance between the interior AJB C283d-16, circuit 4-EG1 (GY/RD), harness side and joint connector No. 4 C223-12, circuit 4-EG1 (GY/RD), harness side.	**Yes** GO to A6 . **No** REPAIR the circuit in question. CARRY OUT the diagnostic tool data link test.

 A0004356 • Measure the resistance between the interior AJB C283d-12, circuit 5-EG1 (BU/RD), harness side and joint connector No. 4 C223-11, circuit 5-EG1 (BU/RD), harness side.  A0004361 • **Are the resistances less than 5 ohms?**	
A6 CHECK FOR AN OPEN BETWEEN JOINT CONNECTOR No. C223	
• Measure the resistance between joint connector No. 4 C223-12, component side and joint connector No. 4 C223-14, component side.  A0004357 • Measure the resistance between joint connector No. 4 C223-9, component side and joint connector No. 4 C223-11, component side.  A0004362 • **Are the resistances less than 5 ohms?**	**Yes** REPAIR the circuit in question between the DLC and joint connector No. 4 C223. CARRY OUT the diagnostic tool data link test. **No** REPAIR joint connector No. 4. TEST the system for normal operation.
A7 CHECK FOR CORRECT ABS/TC MODULE OR STABILITY ASSIST MODULE OPERATION	

• Disconnect all the ABS/TC or stability assist module connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the ABS/TC or stability assist control module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
	Yes
	INSTALL a new ABS/TC or stability assist module. REFER to Section 206-09 . TEST the system for normal operation.
	
	CARRY OUT the diagnostic

• **Is the concern still present?**	tool data link test. **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test B: The Front Electronic Module (FEM) Does Not Respond To The Diagnostic Tool

Refer to Wiring Diagrams Cell 14 for schematic and connector information.

Normal Operation

The FEM communicates with the diagnostic tool through the SCP communications network circuits 4-EG11 (GY) and 5-EG11 (BU). If one of the bus wires becomes shorted to ground or voltage, or if some but not all termination resistors are lost, communications can continue. Check circuits 4-EG11 (GY) and 5-EG11 (BU) between the FEM C201c and the DLC C251. Total resistance values must not be more than 5 ohms. If the resistance is more than 5 ohms, there is either an open in circuits 4-EG11 (GY) and 5-EG11 (BU), damage to the DLC C251, damage to the FEM C201c, or a problem in the in-line joint connectors interior auxiliary junction box (AJB) C283c, C283d or joint connector No. 4 C223.

Possible Causes

- circuits 4-EG11 (GY) and/or 5-EG11 shorted to ground or open
- C201c
- interior AJB C283c, C283d
- joint connector No. 4 C223
- DLC C251
- FEM

PINPOINT TEST B: THE FRONT ELECTRONIC MODULE (FEM) DOES NOT RESPOND TO THE DIAGNOSTIC TOOL

Test Step	Result / Action to Take
B1 CHECK THE FEM C201c FOR DAMAGE	
• Key in OFF position. • Disconnect: the FEM C201c. • Inspect the FEM C201c for damage; repair as necessary. • **Is the FEM C201c OK?**	**Yes** GO to B2 . **No** GO to B7 .
B2 CHECK FOR AN OPEN BETWEEN THE DLC C251 AND THE FEM C201c	
• Measure the resistance between the FEM C201c-7, circuit 4-EG11 (GY), harness side and the DLC C251-2, circuit 4-EG7 (GY/RD), harness side.	**Yes** GO to B7 . **No** GO to B3 .

 A0004363 • Measure the resistance between the FEM C201c-1, circuit 5-EG11 (BU), harness side and the DLC C251-10, circuit 5-EG7 (BU/RD), harness side.  A0004366 • **Is the resistance less than 5 ohms?**	
B3 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283c AND THE FEM C201c	
• Measure the resistance between the FEM C201c-7, circuit 4-EG11 (GY), harness side and the interior AJB C283c-10, circuit 4-EG11 (GY), harness side.  A0004364 • Measure the resistance between the FEM C201c-1, circuit 5-EG11 (BU), harness side and the interior AJB C283c-8, circuit 5-EG11 (BU), harness side.  A0004367 • **Is the resistance less than 5 ohms?**	**Yes** GO to B4 . **No** REPAIR the circuit in question. TEST the system for normal operation.
B4 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283c AND THE INTERIOR AJB C283d	
• Disconnect: Interior AJB C283d. • Measure the resistance between the interior AJB C283d-16, component side and the interior AJB C283c-10, component side.	**Yes** GO to B5 . **No** INSTALL a new interior AJB. TEST the system for normal operation.

 A0004365 • Measure the resistance between the interior AJB C283d-12, component side and the interior AJB C283c-8, component side.  A0004368 • **Are the resistances less than 5 ohms?**	
B5 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283d AND JOINT CONNECTOR No. 4 C223	
• Disconnect: Interior Joint Connector No. 4 C223. • Measure the resistance between the interior the AJB C283d-16, circuit 4-EG1 (GY/RD), harness side and joint connector No. 4 C223-12, circuit 4-EG1 (GY/RD), harness side.  A0067841 • Measure the resistance between the interior C283d-12, circuit 5-EG1 (BU/RD), harness side and joint connector No. 4 C223-11, circuit 5-EG1 (BU/RD), harness side.  A0067842 • **Are the resistances less than 5 ohms?**	**Yes** GO to B6 . **No** REPAIR the circuit in question. CARRY OUT the data link diagnostics test.
B6 CHECK JOINT CONNECTOR No. 4 FOR AN OPEN	
• Measure the resistance between joint connector No. 4 C223-12, component side and joint connector No. 4 C223-14, component side.	**Yes** REPAIR the circuit in question between the DLC and joint connector No. 4 C223. CARRY OUT the data link diagnostics test. **No** REPAIR joint connector No. 4. TEST the system for normal operation.

 A0004357 • Measure the resistance between joint connector No. 4 C223-9, component side and joint connector No. 4 C223-11, component side.  A0004362 • **Are the resistances less than 5 ohms?**	
B7 CHECK FOR CORRECT FEM OPERATION	

• Disconnect all the FEM connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the FEM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FEM. REFER to Front Electronic Module (FEM) in this section. TEST the system for normal operation.
	
	CARRY OUT the data link diagnostics test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: The Restraint Control Module (RCM) Does Not Respond To The Diagnostic Tool

Refer to Wiring Diagrams Cell 14 for schematic and connector information.

Normal Operation

The RCM communicates with the diagnostic tool through the ISO 9141 communications network circuit 4-EE1 (GY/RD). If circuit 4-EE1 (GY/RD) becomes open or shorted to ground communications to that module will not be possible. Check circuit 4-EE1 (GY/RD) between the RCM C310a and the DLC C251. Total resistance values must not be more than 5 ohms. If the resistance is more than 5 ohms there is an open in circuit 4-EE1 (GY/RD), damage to the DLC C251, in-line C212 or damage to the RCM C310a.

Possible Causes

- circuit 4-EE1 (GY/RD) shorted to ground or open
- in-line C212
- RCM C310a
- DLC C251
- RCM

PINPOINT TEST C: THE RESTRAINT CONTROL MODULE (RCM) DOES NOT RESPOND TO THE DIAGNOSTIC TOOL

Test Step	Result / Action to Take
C1 CHECK FOR AN OPEN CIRCUIT BETWEEN THE RCM C310a AND THE DLC C251	
• KEY in OFF position. • Deactivate the air bag system. Refer to Section 501-20B . • Disconnect: RCM C310b. • Inspect the RCM C310b for damage. • **Is the RCM C301b OK?**	**Yes** GO to C2 . **No** REPAIR the RCM C310b as necessary. TEST the system for normal operation.
C2 CHECK FOR AN OPEN CIRCUIT BETWEEN THE RCM C310a AND THE DLC C251	
• Measure the resistance between the DLC C251-7, circuit 4-EE10 (GY/BK), harness side and the RCM C310b-11, circuit 4-EE1 (GY/RD), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to C4 . **No** GO to C3 .
C3 CHECK FOR AN OPEN CIRCUIT BETWEEN THE DLC C251 AND IN-LINE C212M	
• Disconnect: in-line C212. • Measure the resistance between the DLC C251-7, circuit 4-EE10 (GY/BK), harness side and in-line C212F-8, circuit 4-EE10 (GY/BK), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit between the RCM C310b and in-line C212M. TEST the system for normal operation. **No** REPAIR the circuit between the DLC C251 and in-line C212F. TEST the system for normal operation.
C4 CHECK FOR CORRECT RCM OPERATION	

• Disconnect all the RCM connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the RCM connectors and make sure they seat correctly.
	Yes
	INSTALL a new RCM. REFER to Section 501-20B . TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.

• Operate the system and verify the concern is still present. • **Is the concern still present?**	**No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: The Instrument Cluster Does Not Respond To The Diagnostic Tool

Refer to Wiring Diagrams Cell 14 for schematic and connector information.

Normal Operation

The instrument cluster communicates with the diagnostic tool through the SCP communications network circuits 4-EG7 (GY/RD) and 5-EG7 (BU/RD). If one of the bus wires becomes shorted to ground or voltage, or if some but not all termination resistors are lost communications can continue. Check circuits 4-EG7 (GY/RD) and 5-EG7 (BU/RD) between the instrument cluster C220b and the data link connector (DLC) C251. Total resistance values must not be more than 5 ohms. If the resistance is more than 5 ohms there is an open in circuit 4-EG7 (GY/RD) and 5-EG7 (BU/RD), damage to the DLC C251, joint connector No. 4 or damage to the instrument cluster C220b.

Possible Causes

- circuits 4-EG7 (GY/RD) and 5-EG7 (BU/RD) shorted to ground or open
- joint connector No. 4 C223
- instrument cluster C220b
- DLC C251
- instrument cluster

PINPOINT TEST D: THE INSTRUMENT CLUSTER DOES NOT RESPOND TO THE DIAGNOSTIC TOOL

Test Step	Result / Action to Take
D1 CHECK THE INSTRUMENT CLUSTER C220b FOR DAMAGE	
• Key In OFF position. • Disconnect: Instrument Cluster C220b. • Inspect the instrument cluster C220b for damage. • **Is the instrument cluster C220b OK?**	**Yes** GO to D2 . **No** REPAIR the instrument cluster C220b as necessary. TEST the system for normal operation.
D2 CHECK FOR AN OPEN BETWEEN THE DLC C251 AND THE INSTRUMENT CLUSTER C220b	
• Measure the resistance between the instrument cluster C220b-15, circuit 4-EG8 (GY/VT), harness side and the DLC C251-2, circuit 4-EG7 (GY/RD), harness side.	**Yes** GO to D5 . **No** GO to D3 .

 A0004371 • Measure the resistance between the instrument cluster C220b-16, circuit 5-EG8 (BU/WH), harness side and the DLC C251-10, circuit 5-EG7 (BU/RD), harness side.  A0004374 • **Is the resistance less than 5 ohms?**	
D3 CHECK FOR OPEN BETWEEN INSTRUMENT CLUSTER C220b AND JOINT CONNECTOR No. 4 C223	
• Disconnect: Joint Connector No. 4 C223. • Measure the resistance between the instrument cluster C220b-15, circuit 4-EG8 (GY/VT), harness side and joint connector No. 4 C223-13, circuit 4-EG8 (GY/VT), harness side.  A0004372 • Measure the resistance between the instrument cluster C220b-16, circuit 5-EG8 (BU/WH), harness side and joint connector No. 4 C223-10, circuit 5-EG8 (BU/WH), harness side.  A0067810 • **Is the resistance less than 5 ohms?**	**Yes** GO to D4 . **No** REPAIR the circuit in question. TEST the system for normal operation.
D4 CHECK JOINT CONNECTOR No. 4 FOR AN OPEN	
• Measure the resistance between joint connector No. 4 C223-9, component side and joint connector No. 4 C223-10, component side.	**Yes** REPAIR the circuit in question between the DLC C251 and joint connector No. 4 C223. TEST the system for normal operation. **No** REPAIR joint connector No. 4 as

 A0004376 • Measure the resistance between joint connector No. 4 C223-13, component side and joint connector No. 4 C223-14, component side.  A0004373 • **Is the resistance less than 5 ohms?**	necessary. TEST the system for normal operation.
D5 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-00 . TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test E: No Powertrain Control Module (PCM) Standard Corporate Protocol (SCP) Network Communication

Refer to Wiring Diagrams Cell 14 for schematic and connector information.

Normal Operation

The PCM communicates with the modules through the standard corporate protocol (SCP) communications network. Circuits 4-RE8 (GY) and 5-RE8 (BU) receive and transmit data from the PCM to the modules. Degraded SCP performance occurs if one bus line is open, shorted to ground or voltage, or if one but not all termination resistors are lost.

Possible Causes

- circuits 4-RE8 (GY) and/or 5-RE8 (BU) shorted to ground or open
- PCM C175a
- DLC C251
- PCM

PINPOINT TEST E: NO POWERTRAIN CONTROL MODULE (PCM) STANDARD CORPORATE PROTOCOL (SCP) NETWORK COMMUNICATION

Test Step	Result / Action to Take
E1 CHECK THE PCM C175a FOR DAMAGE	
• Key in OFF position. • Disconnect: PCM C175a. • Inspect the PCM C175a for damage. • **Is the PCM C175a OK?**	**Yes** GO to E2 . **No** REPAIR the PCM C175a as necessary. TEST the system for normal operation.
E2 CHECK FOR AN OPEN BETWEEN THE DLC C251 AND THE PCM C175a	
• Measure the resistance between the PCM C175a-3, circuit 4-RE8 (GY), harness side and the DLC C251-2, circuit 4-EG7 (GY/RD), harness side.  A0067934 • Measure the resistance between the PCM C175a-4, circuit 5-RE8 (BU), harness side and the DLC C251-10, circuit 5-EG7 (BU/RD), harness side.  A0067935 • **Are the resistances less than 5 ohms?**	**Yes** GO to E3 . **No** REPAIR the circuit in question. TEST the system for normal operation.
E3 CHECK FOR CORRECT PCM OPERATION	

• Disconnect all the PCM connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-04A or Section 303-04B . TEST the system for normal operation.
	
	CARRY OUT the data link diagnostics test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: The Dual Automatic Temperature Control (DATC) Module Does Not Respond To The Diagnostic Tool

Refer to Wiring Diagrams Cell 14 for schematic and connector information.

Normal Operation

The DATC module communicates with the diagnostic tool through the SCP communications network circuits 4-FA10 (GY/BK) and 5-FA10 (BU/YE). If one of the bus wires becomes shorted to ground or voltage, or if some but not all termination resistors are lost, communications can continue. Check circuits 4-FA10 (GY/BK) and 5-FA10 (BU/YE) between the DATC module C228a and the DLC C251. Total resistance values must not be more than 5 ohms. If the resistance is more than 5 ohms there is an open in circuits 4-FA10 (GY/BK) or 5-FA10 (BU/YE), damage to the DLC C251, the DATC module C228a, or in joint connector No. 4 C223.

Possible Causes

- circuit 4-FA10 (GY/BK) and/or 5-FA10 (BU/YE) shorted to ground or open
- C228a
- joint connector No. 4 C223
- DLC C251
- DATC module

PINPOINT TEST F: THE DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) MODULE DOES NOT RESPOND TO THE DIAGNOSTIC TOOL

Test Step	Result / Action to Take
F1 CHECK THE DATC MODULE C228a FOR DAMAGE	
• Key in OFF position. • Disconnect: DATC Module C228a. • Inspect the DATC module C228a for damage. • **Is the DATC module C228a ok?**	**Yes** GO to F2 . **No** REPAIR the DATC module C228a as necessary. TEST the system for normal operation.
F2 CHECK FOR AN OPEN BETWEEN THE DLC C251 AND THE DATC MODULE C228a	
• Measure the resistance between the DATC module C228a-12, circuit 4-FA10 (GY/BK), harness side and the DLC C251-2, circuit 4-EG7 (GY/RD), harness side.  A0004383 • Measure the resistance between the DATC module C228a-1, circuit 5-FA10 (BU/YE), harness side and the DLC C251-10, circuit 5-EG7 (BU/RD), harness side.	**Yes** GO to F5 . **No** GO to F3 .

 A0004386 • **Are the resistances less than 5 ohms?**	
F3 CHECK FOR AN OPEN BETWEEN THE DATC MODULE C228a AND JOINT CONNECTOR No. 4 C223	
• Disconnect: Joint Connector No. 4 C223. • Measure the resistance between the DATC module C228a-12, circuit 4-FA10 (GY/BK), harness side and joint connector No. 4 C223-15, circuit 4-FA10 (GY/BK), harness side.  A0067813 • Measure the resistance between the DATC module C228a-1, circuit 5-FA10 (BU/YE), harness side and joint connector No. 4 C223-8, circuit 5-FA10 (BU/YE), harness side.  A0067814 • **Are the resistances less than 5 ohms?**	**Yes** GO to F4 . **No** REPAIR the circuit in question. TEST the system for normal operation.
F4 CHECK JOINT CONNECTOR No. 4 FOR AN OPEN	
• Measure the resistance between joint connector No. 4 C223-14, component side and joint connector No. 4 C223-15, component side.  A0004385 • Measure the resistance between joint connector No. 4 C223-8, component side and joint connector No. 4 C223-9, component side.	**Yes** REPAIR the circuit in question between the DLC C251 and joint connector No. 4 C223. CARRY OUT the diagnostic tool data link test. **No** REPAIR joint connector No. 4 C223. TEST the system for normal operation.

 • **Are the resistances less than 5 ohms?**	
F5 CHECK FOR CORRECT DATC MODULE OPERATION	

• Disconnect all the DATC module connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the DATC module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new DATC module. REFER to Section 412-00 . TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test G: The Audio Control Module (ACM) Does Not Respond To The Diagnostic Tool

Refer to Wiring Diagrams Cell 14 for schematic and connector information.

Normal Operation

The ACM module communicates with the diagnostic tool through the SCP communications network circuits 4-EG10 (GY/BK) and 5-EG10 (BU/YE). If one of the bus wires becomes shorted to ground or voltage, or if some but not all termination resistors are lost, communications can continue. Check circuits 4-EG10 (GY/BK) and 5-EG10 (BU/YE) between the ACM C240c and the DLC C251. Total resistance values must not be more than 5 ohms. If the resistance is more than 5 ohms, there is either an open in circuits 4-EG10 (GY/BK) and 5-EG10 (BU/YE), damage to the DLC C251, the ACM C240c, or in joint connector No. 4 C223.

Possible Causes

- circuits 4-EG10 (GY/BK) and 5-EG10 (BU/YE) shorted to ground or open
- C240c
- joint connector No. 4 C223
- DLC C251
- ACM

PINPOINT TEST G: THE AUDIO CONTROL MODULE (ACM) DOES NOT RESPOND TO THE DIAGNOSTIC TOOL

Test Step	Result / Action to Take
G1 CHECK THE ACM C240c FOR DAMAGE	
• Key in OFF position. • Disconnect: ACM C240c. • Inspect the ACM C240c for damage.	**Yes** GO to G2 . **No**

• **Is the ACM C240c OK?**	REPAIR the ACM C240c as necessary. TEST the system for normal operation.
G2 CHECK FOR AN OPEN BETWEEN THE DLC C251 AND THE ACM C240c	
• Measure the resistance between the ACM C240c-3, circuit 4-EG10 (GY/BK), harness side and the DLC C251-2, circuit 4-EG7 (GY/RD), harness side.  A0004389 • Measure the resistance between the ACM C240c-4, circuit 5-EG10 (BU/YE), harness side and the DLC C251-10, circuit 5-EG7 (BU/RD), harness side.  A0004392 • **Are the resistances less than 5 ohms?**	**Yes** GO to G5 . **No** GO to G3 .
G3 CHECK FOR AN OPEN BETWEEN THE ACM C240c AND JOINT CONNECTOR No. 4 C223	
• Disconnect: Joint Connector No. 4 C223. • Measure the resistance between the ACM C240c-3, circuit 4-EG10 (GY/BK), harness side and joint connector No. 4 C223-16, circuit 4-EG10 (GY/BK), harness side.  A0067815 • Measure the resistance between the ACM C290c-4, circuit 5-EG10 (BU/YE), harness side and joint connector No. 4 C223-7, circuit 5-EG10 (BU/YE), harness side.  A0067816	**Yes** GO to G4 . **No** REPAIR the circuit in question. TEST the system for normal operation.

• **Are the resistances less than 5 ohms?**	
G4 CHECK JOINT CONNECTOR No. 4 FOR AN OPEN	
• Measure the resistance between joint connector No. 4 C223-14, component side and joint connector No. 4 C223-16, component side.  • Measure the resistance between joint connector No. 4 C223-7, component side and joint connector No. 4 C223-9, component side.  • **Are the resistances less than 5 ohms?**	**Yes** REPAIR the circuit in question between the DLC C251 and joint connector No. 4 C223. CARRY OUT the diagnostic tool data link test. **No** REPAIR joint connector No. 4 C223. TEST the system for normal operation.
G5 CHECK FOR CORRECT ACM OPERATION	

• Disconnect all the ACM connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the ACM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ACM. REFER to Section 415-00 . TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test H: The Powertrain Control Module (PCM) Does Not Respond To The Diagnostic Tool

Refer to Wiring Diagrams Cell 14 for schematic and connector information.

Normal Operation

The PCM communicates with the diagnostic tool through the controller area network (CAN) circuits 4-EC7 (GY/RD) and 5-EC7 (BU/RD). If one of the bus wires becomes shorted to ground or voltage, or if some but not all termination resistors are lost, communications can continue. Check circuits 4-EC7 (GY/RD) and 5-EC7 (BU/RD) between the PCM C175a and the data link connector (DLC) C251. Total resistance values must not be more than 5 ohms. If the resistance is more than 5 ohms there is an open in circuit 4-EC7 (GY/RD) or 5-EC7 (BU/RD), damage to the DLC C251, or damage to the PCM C175a.

Possible Causes

- 4-EC7 (GY/RD) and/or 5-EC7 (BU/RD) shorted to ground or open
- PCM C175a
- DLC C251
- PCM

PINPOINT TEST H: THE POWERTRAIN CONTROL MODULE (PCM) DOES NOT RESPOND TO THE DIAGNOSTIC TOOL

Test Step	Result / Action to Take
H1 CHECK THE PCM C175a FOR DAMAGE	
• Key in OFF position. • Disconnect: PCM C175a. • Inspect the PCM C175a for damage. • **Is the PCM C175a OK?**	**Yes** GO to H2 . **No** REPAIR the PCM C175a as necessary. TEST the system for normal operation.
H2 CHECK FOR AN OPEN BETWEEN THE DLC C251 AND THE PCM C175a	
• Measure the resistance between the PCM C175a-53, circuit 4-EC7 (GY/RD), harness side and the DLC C251-6, circuit 4-EC7 (GY/RD), harness side.  A0067937 • Measure the resistance between the PCM C175a-54, circuit 5-EC7 (BU/RD), harness side and the DLC C251-14, circuit 5-EC7 (BU/RD), harness side.  A0067936 • **Are the resistances less than 5 ohms?**	**Yes** GO to H3 . **No** REPAIR the circuit in question. TEST the system for normal operation.
H3 CHECK FOR CORRECT PCM OPERATION	

• Disconnect all the PCM connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-04A or Section 303-04B . TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No
	The system is operating correctly at this

	time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test I: The Driver Seat Module (DSM) Does Not Respond To The Diagnostic Tool

Refer to Wiring Diagrams Cell 14 for schematic and connector information.

Normal Operation

The DSM communicates with the diagnostic tool through the SCP communications network circuits 4-AH80 (GY/WH) and 5-AH80 (BU/OG). If circuit 4-AH80 (GY/WH) or 5-AH80 (BU/OG) becomes open or shorted to ground, communications to that module will not be possible. Check circuits 4-AH80 (GY/WH) and 5-AH80 (BU/OG) between the DSM C341c and the DLC C251. Total resistance values must not be more than 5 ohms. If the resistance is more than 5 ohms, there is either an open in circuit 4-AH80 (GY/WH) or 5-AH80 (BU/OG), damage to the DLC C251, damage to the DSM C341c, or a problem with in-line interior auxiliary junction box (AJB) C283c, C283d or joint connector No. 4 C223.

Possible Causes

- circuit 4-AH80 (GY/WH) or 5-AH80 (BU/OG) shorted to ground or open
- C341c
- interior AJB C283c, C283d
- joint connector No. 4 C223
- DLC C251
- DSM

PINPOINT TEST I: THE DRIVER SEAT MODULE (DSM) DOES NOT RESPOND TO THE DIAGNOSTIC TOOL

Test Step	Result / Action to Take
I1 CHECK THE DSM 341c FOR DAMAGE	
• Key in OFF position. • Disconnect: DSM C341c. • Inspect the DSM C341c for damage. • **Is the DSM C341c OK?**	**Yes** GO to I2 . **No** REPAIR the DSM C341c as necessary. TEST the system for normal operation.
I2 CHECK FOR AN OPEN BETWEEN THE DLC C251 AND THE DSM 341c	
• Measure the resistance between the DSM C341c-1, circuit 4-AH80 (GY/WH), harness side and the DLC C251-2, circuit 4-EG7 (GY/RD), harness side.  	**Yes** GO to I7 . **No** GO to I3 .

• Measure the resistance between the DSM C341c-9, circuit 5-AH80 (BU/OG), harness side and the DLC C251-10, circuit 5-EG7 (BU/RD), harness side.  A0004413 • **Are the resistances less than 5 ohms?**	
I3 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283a AND THE DSM 341c	
• Disconnect: Interior AJB C283a. • Measure the resistance between the DSM C341c-1, circuit 4-AH80 (GY/WH), harness side and the interior AJB C283a-16, circuit 4-AH80 (GY/WH), harness side.  A0067938 • Measure the resistance between the DSM C341c-9, circuit 5-AH80 (BU/OG), harness side and the interior AJB C283a-12, circuit 5-AH80 (BU/OG), harness side.  A0004414 • **Are the resistances less than 5 ohms?**	**Yes** GO to I4 . **No** Repair the circuit in question. TEST the system for normal operation.
I4 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283a AND THE INTERIOR AJB C283d	
• Disconnect: Interior AJB C293d. • Measure the resistance between the interior AJB C283a-16, component side and the interior AJB C283d-16, component side.	**Yes** GO to I5 . **No** INSTALL a new AJB. TEST the system for normal operation.

 A0004412 • Measure the resistance between the interior AJB C283a-12, component side and the interior AJB C283d-12, component side.  A0004416 • **Are the resistances less than 5 ohms?**	
I5 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283d AND JOINT CONNECTOR No. 4 C223	
• Disconnect: Interior Joint Connector No. 4 C223. • Measure the resistance between the interior AJB C283d-16, circuit 4-EG1 (GY/RD), harness side and joint connector No. 4 C223-12, circuit 4-EG1 (GY/RD), harness side.  A0067818 • Measure the resistance between the interior AJB C283d-12, circuit 5-EG1 (BU/RD), harness side and joint connector No. 4 C223-11, circuit 5-EG1 (BU/RD), harness side.  A0067818 • **Are the resistances less than 5 ohms?**	**Yes** GO to I6 . **No** REPAIR the circuit in question. CARRY OUT the diagnostic tool data link test in this section.
I6 CHECK JOINT CONNECTOR No. 4 FOR AN OPEN BETWEEN	
• Measure the resistance between joint connector No. 4 C223-12, component side and joint connector No. 4 C223-14, component side.	**Yes** REPAIR the circuit in question between the DLC C251 and joint connector No. 4 C223. CARRY OUT the diagnostic tool data link test.

 A0004357 • Measure the resistance between joint connector No. 4 C223-9, component side and joint connector No. 4 C223-11, component side.  A0004362 • **Are the resistances less than 5 ohms?**	**No** REPAIR joint connector No. 4 C223. TEST the system for normal operation.
I7 CHECK FOR CORRECT DSM OPERATION	

• Disconnect all the DSM connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the DSM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new DSM. REFER to Driver Seat Module (DSM) in this section. TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test J: The Driver Door Module (DDM) Does Not Respond To The Diagnostic Tool

Refer to Wiring Diagrams Cell 14 for schematic and connector information.

Normal Operation

The DDM communicates with the diagnostic tool through the SCP communications network circuits 4-EG13 (GY/OG) and 5-EG13 (GY/OG). If one of the bus wires becomes shorted to ground or voltage, or if some but not all termination resistors are lost communications can continue. Check circuits 4-EG13 (GY/OG) and 5-EG13 (GY/OG) between the DDM C501a and the DLC C251. Total resistance values must not be more than 5 ohms. If the resistance is more than 5 ohms, there is either an open in circuit 4-EG13 (GY/OG) or 5-EG13 (GY/OG), damage to the DLC C251, damage to the DDM C155a, or a problem in the interior auxiliary junction box (AJB) C283c, C283d or joint connector No. 4 C223.

Possible Causes

- circuits 4-EG13 (GY/OG) and 5-EG13 (GY/OG) shorted to ground or open
- C501a
- interior AJB C283c, C283d
- joint connector No. 4 C223
- DLC C251
- DDM

PINPOINT TEST J: THE DRIVER DOOR MODULE (DDM) DOES NOT RESPOND TO THE DIAGNOSTIC TOOL

Test Step	Result / Action to Take
J1 CHECK THE DDM C501a FOR DAMAGE	
• Key in OFF position. • Disconnect: DDM C501a. • Inspect the DDM C501a for damage. • **Is the DDM C501a OK?**	**Yes** GO to J2 . **No** REPAIR the DDM C501a as necessary. TEST the system for normal operation.
J2 CHECK FOR AN OPEN BETWEEN THE DLC C251 AND THE DDM C501a	
• Measure the resistance between the DDM 501a-3, circuit 4-EG13 (GY/OG), harness side and the DLC C251-2, circuit 4-EG7 (GY/RD), harness side.  A0004417 • Measure the resistance between the DDM 501a-4, circuit 5-EG13 (BU/BK), harness side and the DLC C251-10, circuit 5-EG7 (BU/RD), harness side.  A0004420 • **Are the resistances less than 5 ohms?**	**Yes** GO to J7 . **No** GO to J3 .
J3 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283a AND THE DDM C501a	
• Disconnect: Interior AJB C283a. • Measure the resistance between the DDM 501a-3, circuit 4-EG13 (GY/OG), harness side and the interior AJB C283a-8, circuit 4-EG13 (GY/OG), harness side.	**Yes** GO to J4 . **No** REPAIR the circuit in question. TEST the system for normal operation.

 A0004418 • Measure the resistance between the DDM 501a-4, circuit 5-EG13 (BU/BK), harness side and the interior AJB C283a-4, circuit 5-EG13 (BU/BK), harness side.  A0004421 • **Are the resistances less than 5 ohms?**	
J4 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283a AND THE INTERIOR AJB C283d	
• Disconnect: Interior AJB C283d. • Measure the resistance between the interior AJB C283d-16, component side and the interior AJB C283a-8, component side.  A0004419 • Measure the resistance between the interior AJB C283d-12, component side and the interior AJB C283a-4, component side.  A0004422 • **Are the resistances less than 5 ohms?**	**Yes** GO to J5 . **No** INSTALL a new AJB. TEST the system for normal operation.
J5 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283d AND JOINT CONNECTOR No. 4 C223	
• Disconnect: Joint Connector No. 4 C223. • Measure the resistance between the interior AJB C283d-16, circuit 4-EG1 (GY/RD), harness side and joint connector No. 4 C223-12, circuit 4-EG1 (GY/RD), harness side.	**Yes** GO to J6 . **No** REPAIR the circuit in question. TEST the system for normal operation.

 A0067841 • Measure the resistance between the interior AJB C283d-12, circuit 5-EG1 (BU/RD), harness side and joint connector No. 4 C223-11, circuit 5-EG1 (BU/RD), harness side.  A0067842 • **Are the resistances less than 5 ohms?**	
J6 CHECK JOINT CONNECTOR No. 4 FOR AN OPEN	
• Measure the resistance between joint connector No. 4 C223-12, component side and joint connector No. 4 C223-14, component side.  A0004357 • Measure the resistance between joint connector No. 4 C223-9, component side and joint connector No. 4 C223-11, component side.  A0004362 • **Are the resistances less than 5 ohms?**	**Yes** REPAIR the circuit in question between the DLC C251 and joint connector No. 4 C223. CARRY OUT the diagnostic tool data link test. **No** REPAIR joint connector No. 4 C223. TEST the system for normal operation.
J7 CHECK FOR CORRECT DDM OPERATION	

• Disconnect all the DDM connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the DDM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
	Yes
	INSTALL a new DDM. REFER to Driver Door Module (DDM) in this section. TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No

• **Is the concern still present?**	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test K: The Rear Electronic Module (REM) Does Not Respond To The Diagnostic Tool

Refer to Wiring Diagrams Cell 14 for schematic and connector information.

Normal Operation

The REM communicates with the diagnostic tool through the SCP communications network circuits 4-EG12 (GY/WH) and 5-EG12 (BU/OG). If one of the bus wires becomes shorted to ground or voltage, or if some but not all termination resistors are lost, communications can continue. Check circuits 4-EG12 (GY/WH) and 5-EG12 (BU/OG) between the in-line joint connectors C283b, C283d or C223 and the DLC C251. Total resistance values must not be more than 5 ohms. If the resistance is more than 5 ohms, there is either an open in circuits 4-EG12 (GY/WH) and 5-EG12 (BU/OG), damage to the DLC C251, damage to the REM 420b, or a problem in the interior auxiliary junction box (AJB) C283c, C283d or joint connector No. 4 C223.

Possible Causes

- circuits 4-EG12 (GY/WH) and 5-EG12 (BU/OG) shorted to ground or open
- REM 420b
- interior AJB C283c, C283d
- joint connector No. 4 C223
- DLC C251
- REM

PINPOINT TEST K: THE REAR ELECTRONIC MODULE (REM) DOES NOT RESPOND TO THE DIAGNOSTIC TOOL

Test Step	Result / Action to Take
K1 CHECK THE REM C420b FOR DAMAGE	
• Key in OFF position. • Disconnect: REM C420b. • Inspect the REM C420b for damage. • **Is the REM C420b OK?**	**Yes** GO to K2 . **No** REPAIR the REM C420b as necessary. TEST the system for normal operation.
K2 CHECK FOR AN OPEN BETWEEN THE DLC C251 AND THE REM C420b	
• Measure the resistance between the REM C420b-1, circuit 4-EG12 (GY/WH), harness side and the DLC C251-2, circuit 4-EG7 (GY/RD), harness side.  	**Yes** GO to K7 . **No** GO to K3 .

• Measure the resistance between the REM C420b-2, circuit 5-EG12 (BU/OG), harness side and the DLC C251-10, circuit 5-EG7 (BU/RD), harness side.  A0004426 • **Are the resistances less than 5 ohms?**	
K3 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283b AND THE REM C420b	
• Disconnect the interior AJB C283b. • Measure the resistance between the REM C420b-1, circuit 4-EG12 (GY/WH), harness side and the interior AJB C283b-16, circuit 4-EG12 (GY/WH), harness side.  A0004424 • Measure the resistance between the REM C420b-2, circuit 5-EG12 (BU/OG), harness side and the interior AJB C283b-12, circuit 5-EG12 (BU/OG), harness side.  A0004427 • **Are the resistances less than 5 ohms?**	**Yes** GO to K4 . **No** REPAIR the circuit in question. TEST the system for normal operation.
K4 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283b AND THE INTERIOR AJB C283d	
• Disconnect: Interior AJB C283d. • Measure the resistance between the interior AJB C283d-16, component side and the interior AJB C283b-16, component side.	**Yes** GO to K5 . **No** INSTALL a new interior AJB. TEST the system for normal operation.

 A0004425 • Measure the resistance between the interior AJB C283d-12, component side and the interior AJB C283b-12, component side.  A0004428 • **Are the resistances less than 5 ohms?**	
K5 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283d AND JOINT CONNECTOR No. 4 C223	
• Disconnect: Interior Joint Connector No. 4 C223. • Measure the resistance between the interior AJB C283d-16, circuit 4-EG1 (GY/RD), harness side and joint connector No. 4 C223-12, circuit 4-EG1 (GY/RD), harness side.  A0067841 • Measure the resistance between the interior AJB C283d-12, circuit 5-EG1 (BU/RD), harness side and joint connector No. 4 C223-11, circuit 5-EG1 (BU/RD), harness side.  A0067842 • **Are the resistances less than 5 ohms?**	**Yes** GO to K6 . **No** REPAIR the circuit in question. CARRY OUT the diagnostic tool data link test.
K6 CHECK JOINT CONNECTOR No. 4 FOR AN OPEN	
• Measure the resistance between joint connector No. 4 C223-12, component side and joint connector No. 4 C223-14, component side.	**Yes** REPAIR the circuit in question between the DLC C251 and joint connector No. 4 C223. CARRY OUT the diagnostic tool data link test.

 A0004357 • Measure the resistance between joint connector No. 4 C223-9, component side and joint connector No. 4 C223-11, component side.  A0004362 • **Are the resistances less than 5 ohms?**	**No** REPAIR joint connector No. 4 C223. TEST the system for normal operation.
K7 CHECK FOR CORRECT REM OPERATION	

• Disconnect all the REM connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the REM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new REM. REFER to Rear Electronic Module (REM) in this section. TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test L: The Navigation System Module Does Not Respond To The Diagnostic Tool

Refer to Wiring Diagrams Cell 14 for schematic and connector information.

Normal Operation

The navigation system module communicates with the diagnostic tool through the SCP communications network circuits 4-EG17 (GY/BK) and 5-EG17 (BU/YE). If one of the bus wires becomes shorted to ground or voltage, or if some but not all termination resistors are lost, communications can continue. Check circuits 4-EG17 (GY/BK) and 5-EG17 (BU/YE) between the navigation system module C4209 and the data link connector (DLC) C251. Total resistance values must not be more than 5 ohms. If the resistance is more than 5 ohms, there is either an open in circuit 4-EG17 (GY/BK) and 5-EG17 (BU/YE), damage to the DLC C251, damage to the navigation system module C4209, or a problem in the interior auxiliary junction box (AJB) C283c, C283d, joint connector No. 5 C427 or joint connector No. 4 C223.

Possible Causes

- circuits 4-EG17 (GY/BK) and 5-EG17 (BU/YE) shorted to ground or open
- navigation system module C4209
- interior AJB C283c C283d
- joint connector No. 4 C223
- joint connector No. 5 C427

- DLC C251
- navigation system module

PINPOINT TEST L: THE NAVIGATION SYSTEM MODULE DOES NOT RESPOND TO THE DIAGNOSTIC TOOL

Test Step	Result / Action to Take
L1 CHECK THE NAVIGATION SYSTEM MODULE C4209 FOR DAMAGE	
• Key in OFF position. • Disconnect: Navigation System Module C4209. • Inspect the navigation system module C4209 for damage. • **Is the navigation system module C4209 OK?**	**Yes** GO to L2 . **No** REPAIR the navigation system module C4209 as necessary. TEST the system for normal operation.
L2 CHECK FOR AN OPEN BETWEEN THE DLC C251 AND THE NAVIGATION SYSTEM MODULE C4209	
• Measure the resistance between the navigation system module C4209-4, circuit 4-EG17 (GY/BK), harness side and the DLC C251-2, circuit 4-EG7 (GY/RD), harness side.  A0057786 • Measure the resistance between the navigation system module C4209-16, circuit 5-EG17 (BU/YE), harness side and the DLC C251-10, circuit 5-EG7 (BU/RD), harness side.  A0057787 • **Are the resistances less than 5 ohms?**	**Yes** GO to L9 . **No** GO to L3 .
L3 CHECK FOR AN OPEN BETWEEN JOINT CONNECTOR No. 5 C427 AND THE NAVIGATION SYSTEM MODULE C4209	
• Disconnect: Joint Connector No. 5 C427. • Measure the resistance between the navigation system module C4209-4, circuit 4-EG17 (GY/BK), harness side and joint connector No. 5 C427-4, circuit 4-EG17 (GY/BK), harness side.	**Yes** GO to L4 . **No** REPAIR the circuit in question. TEST the system for normal operation.

 A0057788 • Measure the resistance between the navigation system module C4209-16, circuit 5-EG17 (BU/YE), harness side and joint connector No. 5 C427-15, circuit 5-EG17 (BU/YE), harness side.  A0057789 • **Are the resistances less than 5 ohms?**	
L4 CHECK JOINT CONNECTOR No. 5 FOR AN OPEN	
• Measure the resistance between joint connector No. 5 C427-1, component side and joint connector No. 5 C427-4, component side.  A0067843 • Measure the resistance between joint connector No. 5 C427-12, component side and joint connector No. 5 C427-15, component side.  A0067844 • **Are the resistances less than 5 ohms?**	**Yes** GO to L5 . **No** REPAIR joint connector No. 5 C427 as necessary. TEST the system for normal operation.
L5 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283b AND JOINT CONNECTOR No. 5 C427	
• Disconnect: Interior AJB C283b. • Measure the resistance between the interior AJB C283b-8, circuit 4-EG1 (GY/RD), harness side and joint connector No. 5 C427-1, circuit 4-EG1 (GY/RD), harness side.	**Yes** GO to L6 . **No** REPAIR the circuit in question. CARRY OUT the diagnostic tool data link test.

 A0067845 • Measure the resistance between the interior AJB C283b-4, circuit 5-EG1 (BU/RD), harness side and joint connector No. 5 C427-12, circuit 5-EG1 (BU/RD), harness side.  A0067846 • **Are the resistances less than 5 ohms?**	
L6 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283b AND THE INTERIOR AJB C283d	
• Disconnect: Interior AJB C283d. • Measure the resistance between the interior AJB C283d-16, component side and the interior AJB C283b-8, component side.  A0057792 • Measure the resistance between the interior AJB C283d-12, component side and the interior AJB C283b-4, component side.  A0067846 • **Are the resistances less than 5 ohms?**	**Yes** GO to L7 . **No** INSTALL a new interior AJB. TEST the system for normal operation.
L7 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283d AND JOINT CONNECTOR No. 4 C223	
• Disconnect: Interior Joint Connector No. 4 C223. • Measure the resistance between the interior AJB C283d-16, circuit 4-EG1 (GY/RD), harness side and joint connector No. 4 C223-12, circuit 4-EG1 (GY/RD), harness side.	**Yes** GO to L8 . **No** REPAIR the circuit in question. CARRY OUT the diagnostic tool data link test.

 A0067847 • Measure the resistance between the interior AJB C283d-12, circuit 5-EG1 (BU/RD), harness side and joint connector No. 4 C223-11, circuit 5-EG1 (BU/RD), harness side.  A0067848 • **Are the resistances less than 5 ohms?**	
L8 CHECK JOINT CONNECTOR No. 4 FOR AN OPEN	
• Measure the resistance between joint connector No. 4 C223-12, component side and joint connector No. 4 C223-14, component side.  A0004357 • Measure the resistance between joint connector No. 4 C223-9, component side and joint connector No. 4 C223-11, component side.  A0004362 • **Are the resistances less than 5 ohms?**	**Yes** REPAIR the circuit in question between the DLC C251 and joint connector No. 4 C223. CARRY OUT the diagnostic tool data link test. **No** REPAIR joint connector No. 4 C223. TEST the system for normal operation.
L9 CHECK FOR CORRECT NAVIGATION SYSTEM MODULE OPERATION	

• Disconnect all the navigation system module connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the navigation system module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new navigation system module. REFER to Section 419-02 . TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No

	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test M: The Driver Temperature Controlled Seat Module Does Not Respond To The Diagnostic Tool

Refer to Wiring Diagrams Cell 14 for schematic and connector information.

Normal Operation

The driver temperature controlled seat module communicates with the diagnostic tool through the UBP communications network circuit 4-HC21 (GY/OG). If circuit 4-HC21 (GY/OG) becomes open or shorted to ground, communications to that module will not be possible. Check circuit 4-HC21 (GY/OG) between the temperature controlled seat module and the DLC C251. Total resistance values must not be more than 5 ohms. If the resistance is more than 5 ohms, there is either an open in circuit 4-HC21 (GY/OG), damage to the DLC C251, damage to the driver temperature controlled seat module C3031a, or a problem in the in-line connectors C213, C315 or joint connector No. 1 C261.

Possible Causes

- circuit 4-HC21 (GY/OG) shorted to ground or open
- driver temperature controlled seat module C3031a
- joint connector No. 1 C261
- in-line C213
- in-line C315
- DLC C251
- driver temperature controlled seat module

PINPOINT TEST M: THE DRIVER TEMPERATURE CONTROLLED SEAT MODULE DOES NOT RESPOND TO THE DIAGNOSTIC TOOL

Test Step	Result / Action to Take
M1 CHECK THE DRIVER TEMPERATURE CONTROLLED SEAT MODULE C3031a FOR DAMAGE	
• Key in OFF position. • Disconnect: Driver Temperature Controlled Seat Module C3031a. • Inspect the driver temperature controlled seat module C3031a for damage. • **Is the driver temperature controlled seat module C3031a OK?**	**Yes** GO to M2 . **No** REPAIR the driver temperature controlled seat module C3031a. CARRY OUT the diagnostic tool data link test.
M2 CHECK CIRCUIT 4-HC21 (GY/OG) BETWEEN THE DLC C251 AND THE DRIVER TEMPERATURE CONTROLLED SEAT MODULE C3031a FOR AN OPEN	

• Measure the resistance between the driver temperature controlled seat module C3031a-1, circuit 4-HC21 (GY/OG), harness side and the DLC C251-3, circuit 4-ED6 (GY), harness side.  A0057798 • **Is the resistance less than 5 ohms?**	**Yes** GO to M9 . **No** GO to M3 .
M3 CHECK IN-LINE C315 FOR DAMAGE	
• Disconnect: In-Line C315. • Inspect in-lines C315M and C315F for damage. • **Are in-lines C315M and OK?**	**Yes** GO to M4 . **No** REPAIR in-lines C315M and . CARRY OUT the diagnostic tool data link test.
M4 CHECK CIRCUIT 4-HC21 (GY/OG) BETWEEN IN-LINE C315F AND THE DRIVER TEMPERATURE CONTROLLED SEAT MODULE C3031a FOR AN OPEN	
• Measure the resistance between the driver temperature controlled seat module C3031a-1, circuit 4-HC21 (GY/OG), harness side and in-line C315M-10, circuit 4-HC21 (GY/OG), harness side.  A0057799 • **Is the resistance less than 5 ohms?**	**Yes** GO to M5 . **No** REPAIR the circuit between in-line C315M and the driver temperature controlled seat module C3031a. CARRY OUT the diagnostic tool data link test.
M5 CHECK IN-LINE C213 FOR DAMAGE	
• Disconnect: In-Line C213. • Inspect in-lines C213M and C213F for damage. • **Are in-lines C213M and OK?**	**Yes** GO to M6 . **No** REPAIR in-lines C213M and C213F. CARRY OUT the diagnostic tool data link test.
M6 CHECK CIRCUIT 4-HC21 (GY/OG) BETWEEN IN-LINE C315F AND IN-LINE C213F FOR AN OPEN	
• Measure the resistance between in-line C213F-11, circuit 4-HC1 (GY/RD), harness side and in-line C315M-10, circuit 4-HC21 (GY/OG), harness side.	**Yes** GO to M7 . **No** REPAIR the circuit between in-line C315F and in-line C213F. CARRY

 A0057800 • **Is the resistance less than 5 ohms?**	OUT the diagnostic tool data link test.
M7 CHECK CIRCUIT 4-HC1 (GY/RD) BETWEEN IN-LINE C213M AND JOINT CONNECTOR No. 1 C261 FOR AN OPEN	
• Measure the resistance between in-line C213M-11, circuit 4-HC1 (GY/RD), harness side and joint connector No. 1 C261-11, circuit 4-HC1 (GY/RD), harness side.  A0067849 • **Is the resistance less than 5 ohms?**	**Yes** GO to M8 . **No** REPAIR the circuit between in-line C213M and joint connector No. 1 C261. CARRY OUT the diagnostic tool data link test.
M8 CHECK JOINT CONNECTOR No. 1 FOR AN OPEN	
• Measure the resistance between joint connector No. 1 C261-10, component side and joint connector No. 1 C261-11, component side.  A0067850 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit between joint connector No. 1 C261 and the DLC C251. CARRY OUT the diagnostic tool data link test. **No** REPAIR joint connector No. 1 C261 as necessary. CARRY OUT the diagnostic tool data link test.
M9 CHECK FOR CORRECT DRIVER TEMPERATURE CONTROLLED SEAT MODULE OPERATION	

• Disconnect all the driver temperature controlled seat module connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the driver temperature controlled seat module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new driver temperature controlled seat module. REFER to Section 501-10 . TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test N: The Passenger Temperature Controlled Seat Module Does Not Respond To The Diagnostic Tool

Refer to Wiring Diagrams Cell 14 for schematic and connector information.

Normal Operation

The passenger temperature controlled seat module communicates with the diagnostic tool through the UBP communications network circuit 4-HC22 (GY). If circuit 4-HC22 (GY) becomes open or shorted to ground, communications to that module will not be possible. Check circuit 4-HC22 (GY) between the passenger temperature controlled seat module and the DLC C251. Total resistance values must not be more than 5 ohms. If the resistance is more than 5 ohms, there is either an open in circuit 4-HC22 (GY), damage to the DLC C251, damage to the passenger temperature controlled seat module C3031a, or a problem in the in-line connectors C213, C313 or joint connector No. 1 C261.

Possible Causes

- circuit 4-HC22 (GY) shorted to ground or open
- passenger temperature controlled seat module C3036a
- joint connector No. 1 C261
- in-line C213
- in-line C313
- DLC C251
- passenger temperature controlled seat module

PINPOINT TEST N: THE PASSENGER TEMPERATURE CONTROLLED SEAT MODULE DOES NOT RESPOND TO THE DIAGNOSTIC TOOL

Test Step	Result / Action to Take
N1 CHECK THE PASSENGER TEMPERATURE CONTROLLED SEAT MODULE C3036a FOR DAMAGE	
• Key in OFF position. • Disconnect: Passenger Temperature Controlled Seat Module C3036a. • Inspect the passenger temperature controlled seat module C3036a for damage. • **Is the passenger temperature controlled seat module C3036a OK?**	**Yes** GO to N2 . **No** REPAIR the passenger temperature controlled seat module C3036a. CARRY OUT the diagnostic tool data link test.
N2 CHECK CIRCUIT 4-HC22 (GY) BETWEEN THE DLC C251 AND THE PASSENGER TEMPERATURE CONTROLLED SEAT MODULE C3036a FOR AN OPEN	
• Measure the resistance between the passenger temperature controlled seat module C3036a-1, circuit 4-HC22 (GY), harness side and the DLC C251-3, circuit 4-ED6 (GY), harness side.	**Yes** GO to N9 . **No** GO to N3 .

 A0057798 • **Is the resistance less than 5 ohms?**	
N3 CHECK IN-LINE C313 FOR DAMAGE	
• Disconnect: In-Line C313. • Inspect in-lines C313M and C313F for damage. • **Are in-lines C313M and C313FOK?**	**Yes** GO to N4 . **No** REPAIR in-lines C313M and C313F. CARRY OUT the diagnostic tool data link test.
N4 CHECK CIRCUIT 4-HC22 (GY) BETWEEN IN-LINE C313F AND THE PASSENGER TEMPERATURE CONTROLLED SEAT MODULE C3036a FOR AN OPEN	
• Measure the resistance between the passenger temperature controlled seat module C3036a-1, circuit 4-HC22 (GY), harness side and in-line C313M-10, circuit 4-HC22 (GY), harness side.  A0057799 • **Is the resistance less than 5 ohms?**	**Yes** GO to N5 . **No** REPAIR the circuit between in-line C313M and the passenger temperature controlled seat module C3036a. CARRY OUT the diagnostic tool data link test.
N5 CHECK IN-LINE C213 FOR DAMAGE	
• Disconnect: In-Line C213. • Inspect in-lines C213M and C213F for damage. • **Are in-lines C213M and C213FOK?**	**Yes** GO to N6 . **No** REPAIR in-lines C213M and C213F. CARRY OUT the diagnostic tool data link test.
N6 CHECK CIRCUIT 4-HC22 (GY) BETWEEN IN-LINE C313F AND IN-LINE C213F FOR AN OPEN	
• Measure the resistance between in-line C213F-11, circuit 4-HC1 (GY/RD), harness side and in-line C313F-10, circuit 4-HC22 (GY), harness side.  A0057803	**Yes** GO to N7 . **No** REPAIR the circuit between in-line C313F and in-line C213F. CARRY OUT the diagnostic tool data link test.

• **Is the resistance less than 5 ohms?**	
N7 CHECK CIRCUIT 4-HC1 (GY/RD) BETWEEN IN-LINE C213M AND JOINT CONNECTOR No. 1 C261 FOR AN OPEN	
• Measure the resistance between in-line C213M-11, circuit 4-HC1 (GY/RD), harness side and joint connector No. 1 C261-11, circuit 4-HC1 (GY/RD), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to N8 . **No** REPAIR the circuit between in-line C213M and joint connector No. 1 C261. CARRY OUT the diagnostic tool data link test.
N8 CHECK JOINT CONNECTOR No. 1 FOR AN OPEN	
• Measure the resistance between joint connector No. 1 C261-10, component side and joint connector No. 1 C261-11, component side.  • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit between joint connector No. 1 C261 and the DLC C251. CARRY OUT the diagnostic tool data link test. **No** REPAIR joint connector No. 1 C261 as necessary. CARRY OUT the diagnostic tool data link test.
N9 CHECK FOR CORRECT PASSENGER TEMPERATURE CONTROLLED SEAT MODULE OPERATION	

• Disconnect all the passenger temperature controlled seat module connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the passenger temperature controlled seat module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new passenger temperature controlled seat module. REFER to Section 501-10 . TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test O: No Standard Corporate Protocol (SCP) Network Communication

Refer to Wiring Diagrams Cell 14 for schematic and connector information.

Normal Operation

The anti-lock brake system/traction control (ABS/TC) module or stability assist module, dual automatic temperature control (DATC) module, audio control module (ACM), rear electronic module (REM), front electronic module (FEM), electronic parking brake module, driver seat module (DSM), driver door module (DDM), navigation system module, and the instrument cluster communicate with the diagnostic tool through the SCP communications network circuits. The powertrain control module (PCM) communicates with all modules on the SCP network. If one of the bus wires become shorted to ground or voltage, or if some but not all termination resistors are lost, communications can continue. If a module is lost due to internal concerns, communications can continue to all other modules. Check the SCP communications network circuits between the PCM C175a, ACM C240c, ABS/TC control module C135 or stability assist module C155, DATC module C228a, instrument cluster C220b, navigation system module C4209, electronic parking brake module C4205b, DDM C501a, DSM CC341c, FEM C201c, REM C420b, and the DLC C251. Total resistance values must not be more than 5 ohms. If the resistance is more than 5 ohms there is an open in one or both SCP communications network circuits, damage to the PCM C175a, ACM C240c, ABS/TC control module C135, stability assist module C155, DATC module C228a, instrument cluster C220b, navigation system module C4209, electronic parking brake module C4205b, DDM C501a, DSM CC341c, FEM C201c, REM C420b, in-line C315, joint connector No. 4 C223, interior auxiliary junction box (AJB) C283a, C283b, C283c, C283d, joint connector No. 5 C427 and the DLC C251. If, after individual checks of each circuit leading to a module show resistance values less than 5 ohms and no in-line connector issues present, the diagnostic tool data link test must be run with the module in question disconnected. If the data links diagnostics test passes with the module in question disconnected it is the source of the concern and should be removed and a new module installed.

Possible Causes

- SCP communications network circuits
- interior AJB C283a, C283b, C283c, C283d
- joint connector No. 4 C223
- joint connector No. 5 C427
- in-line C315
- DLC C251
- ABS/TC module or stability assist module
- PCM
- DATC module
- ACM
- FEM
- REM
- DSM
- DDM
- instrument cluster
- navigation system module
- electronic parking brake module

PINPOINT TEST O: NO STANDARD CORPORATE PROTOCOL (SCP) NETWORK COMMUNICATION

Test Step	Result / Action to Take
O1 CHECK THE DLC C251 FOR DAMAGE	
• Key in OFF position. • Inspect the DLC C251 for damage. • **Is the DLC C251 OK?**	**Yes** GO to O2 . **No**

	REPAIR the DLC C251. CARRY OUT the diagnostic tool data link test.
O2 CHECK THE PCM C175a FOR DAMAGE	
• Key in OFF position. • Disconnect: PCM C175a. • Inspect the PCM C175a for damage. • **Is the PCM C175a OK?**	**Yes** GO to O3 . **No** REPAIR the PCM C175a as necessary. TEST the system for normal operation.
O3 CHECK FOR AN OPEN BETWEEN THE DLC C251 AND THE PCM C175a	
• Measure the resistance between the PCM C175a-3, circuit 4-RE8 (GY), harness side and the DLC C251-2, circuit 4-EG7 (GY/RD), harness side.  A0067934 • Measure the resistance between the PCM C175a-4, circuit 5-RE8 (BU), harness side and the DLC C251-10, circuit 5-EG7 (BU/RD), harness side.  A0067935 • **Are the resistances less than 5 ohms?**	**Yes** GO to O8 . **No** GO to O4 .
O4 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283c AND THE PCM C175a	
• Disconnect: Interior AJB C283c. • Measure the resistance between the PCM C175a-3, circuit 4-RE8 (GY), harness side and the interior AJB C283c-4, circuit 4-RE8 (GY), harness side.  A0067932 • Measure the resistance between the PCM C175a-4, circuit 5-RE8 (BU), harness side and the interior AJB C283c-1, circuit 5-RE8 (BU), harness side.	**Yes** GO to O5 . **No** REPAIR the circuit in question. TEST the system for normal operation.

 A0067933 • **Are the resistances less than 5 ohms?**	
O5 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283c AND THE INTERIOR AJB C283d	
• Disconnect: Interior AJB C283d. • Measure the resistance between the interior AJB C283d-16, component side and the interior AJB C283c-4, component side.  A0004379 • Measure the resistance between the interior AJB C283d-12, component side and the interior AJB C283c-1, component side.  A0004382 • **Are the resistances less than 5 ohms?**	**Yes** GO to O6 . **No** INSTALL a new AJB. TEST the system for normal operation.
O6 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283d AND JOINT CONNECTOR No. 4 C223	
• Disconnect: Interior Joint Connector No. 4 C223. • Measure the resistance between the interior AJB C283d-16, circuit 4-EG1 (GY/RD), harness side and joint connector No. 4 C223-12, circuit 4-EG1 (GY/RD), harness side.  A0067847 • Measure the resistance between the interior AJB C283d-12, circuit 5-EG1 (BU/RD), harness side and joint connector No. 4 C223-11, circuit 5-EG1 (BU/RD), harness side.	**Yes** GO to O7 . **No** REPAIR the circuit in question. CARRY OUT the diagnostic tool data link test.

 A0067848 • **Are the resistances less than 5 ohms?**	
O7 CHECK JOINT CONNECTOR No. 4 FOR AN OPEN	
• Measure the resistance between joint connector No. 4 C223-12, component side and joint connector No. 4 C223-14, component side.  A0004357 • Measure the resistance between joint connector No. 4 C223-9, component side and joint connector No. 4 C223-11, component side.  A0004362 • **Are the resistances less than 5 ohms?**	**Yes** REPAIR the circuit in question between the DLC C251 and joint connector No. 4 C223. CARRY OUT the diagnostic tool data link test. **No** REPAIR joint connector No. 4 C223. TEST the system for normal operation.
O8 CHECK THE SCP NETWORK WITH THE PCM C175a DISCONNECTED	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: DATA LINK DIAGNOSTICS Test. • **Did the diagnostic tool indicate system passed?**	**Yes** GO to O77 . **No** GO to O9 .
O9 CHECK THE ABS/TC CONTROL MODULE OR STABILITY ASSIST MODULE FOR DAMAGE	
• Key in OFF position. • Connect: PCM C175a. • Connect: Interior AJB C283c and C283d. • Connect: Joint Connector No. 4 C223. • Disconnect: ABS/TC module C135, or the stability assist module C155. • Inspect the ABS/TC module C135 or stability assist module C155 for damage. • **Is the ABS/TC module C135 or stability assist module C155 ok?**	**Yes** GO to O10 . **No** REPAIR the ABS/TC module C135 or stability assist module C155 as necessary. TEST the system for normal operation.
O10 CHECK FOR AN OPEN BETWEEN THE DLC C251 AND THE ABS/TC MODULE C135 OR THE STABILITY ASSIST	

MODULE C155	
• If equipped with an ABS/TC module, measure the resistance between the ABS/TC module C135-12, circuit 4-CF6 (GY), harness side and the DLC C251-2, circuit 4-EG7 (GY/RD), harness side. If equipped with a stability assist module, measure the resistance between the stability assist module C155-12, circuit 4-CF6 (GY), harness side and the DLC C251-2, circuit 4-EG7 (GY/RD), harness side.  A0067783 • If equipped with an ABS/TC module, measure the resistance between the ABS/TC module C135-14, circuit 5-CF6 (BU), harness side and the C251-10, circuit 5-EG7 (BU/RD), harness side. If equipped with a stability assist module, measure the resistance between the stability assist module C155-14, circuit 5-CF6 (BU), harness side and the C251-10, circuit 5-EG7 (BU/RD), harness side.  A0067784 • **Are the resistances less than 5 ohms?**	**Yes** GO to O15 . **No** GO to O11 .
O11 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283c AND ABS/TC MODULE C135 OR STABILITY ASSIST MODULE C155	
• Disconnect: Interior AJB C283c. • If equipped with an ABS/TC module, measure the resistance between the ABS/TC module C135-12, circuit 4-CF6 (GY), harness side and the interior AJB C283c-5, circuit 4-CF6 (GY), harness side. If equipped with a stability assist module, measure the resistance between the stability assist module C155-12, circuit 4-CF6 (GY), harness side and the interior AJB C283c-5, circuit 4-CF6 (GY), harness side.  A0067785 • If equipped with an ABS/TC module, measure the resistance between the ABS/TC module C135-14, circuit 5-CF6 (BU), harness side and the interior AJB C283c-6, circuit 5-CF6 (BU),	**Yes** GO to O12 . **No** REPAIR the circuit in question. CARRY OUT the diagnostic tool data link test.

harness side. If equipped with a stability assist module, measure the resistance between the stability assist control module C155-14, circuit 5-CF6 (BU), harness side and the interior AJB C283c-6, circuit 5-CF6 (BU), harness side.  A0067786 • **Are the resistances less than 5 ohms?**	
O12 CHECK FOR AN OPEN BETWEEN INTERIOR AJB C283c AND INTERIOR AJB C283d	
• Disconnect: Interior AJB C283d. • Measure the resistance between the interior AJB C283d-16, and the interior AJB C283c-5, component side.  A0004355 • Measure the resistance between the interior AJB C283d-12, and the interior AJB C283c-6, component side.  A0004360 • **Are the resistances less than 5 ohms?**	**Yes** GO to O13 . **No** INSTALL a new interior AJB. TEST the system for normal operation.
O13 CHECK FOR AN OPEN BETWEEN INTERIOR AJB C283d AND JOINT CONNECTOR No. 4 C223	
• Disconnect: Interior Joint Connector No. 4 C223. • Measure the resistance between the interior AJB C283d-16, circuit 4-EG1 (GY/RD), harness side and joint connector No. 4 C223-12, circuit 4-EG1 (GY/RD), harness side.  A0067847 • Measure the resistance between the interior C283d-12, circuit 5-EG1 (BU/RD), harness side and joint connector No. 4 C223-22, circuit 5-EG1 (BU/RD), harness side.	**Yes** GO to O14 . **No** REPAIR the circuit in question. CARRY OUT the diagnostic tool data link test.

 A0067848 • **Are the resistances less than 5 ohms?**	
O14 CHECK JOINT CONNECTOR No. 4 FOR AN OPEN	
• Measure the resistance between joint connector No. 4 C223-12, component side and joint connector No. 4 C223-14, component side.  A0004357 • Measure the resistance between joint connector No. 4 C223-9, component side and joint connector No. 4 C223-11, component side.  A0004362 • **Are the resistances less than 5 ohms?**	**Yes** REPAIR the circuit in question between the DLC C251 and joint connector No. 4 C223. CARRY OUT the diagnostic tool data link test. **No** REPAIR joint connector No. 4 C223. TEST the system for normal operation.
O15 CHECK THE SCP NETWORK WITH THE ABS/TC C135 OR STABILITY ASSIST MODULE C155 DISCONNECTED	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: DATA LINK DIAGNOSTICS Test. • **Did the diagnostic tool indicate system passed?**	**Yes** GO to O78 . **No** GO to O16 .
O16 CHECK THE DATC MODULE C228a FOR DAMAGE	
• Key in OFF position. • Connect: ABS/TC module C135, or stability assist module C155. • Connect: Interior AJB C283c and C283d. • Connect: Joint Connector No. 4 C223. • Disconnect: DATC Module C228a. • Inspect the DATC module C228a for damage. • **Is the DATC module C228a ok?**	**Yes** GO to O17 . **No** REPAIR the DATC module C228a as necessary. TEST the system for normal operation.
O17 CHECK FOR AN OPEN BETWEEN THE DLC C251 AND THE DATC MODULE C228a	

• Measure the resistance between the DATC module C228a-12, circuit 4-FA10 (GY/BK), harness side and the DLC C251-2, circuit 4-EG7 (GY/RD), harness side.  A0004383 • Measure the resistance between the DATC module C228a-1, circuit 5-FA10 (BU/YE), harness side and the DLC C251-10, circuit 5-EG7 (BU/RD), harness side.  A0004386 • **Are the resistances less than 5 ohms?**	**Yes** GO to O20 **No** GO to O18 .
O18 CHECK FOR AN OPEN BETWEEN THE DATC MODULE C228a AND JOINT CONNECTOR No. 4 C223	
• Disconnect: Joint Connector No. 4 C223. • Measure the resistance between the DATC module C228a-12, circuit 4-FA10 (GY/BK), harness side and joint connector No. 4 C223-15, circuit 4-FA10 (GY/BK), harness side.  A0067813 • Measure the resistance between the DATC module C228a-1, circuit 5-FA10 (BU/YE), harness side and joint connector No. 4 C223-8, circuit 5-FA10 (BU/YE), harness side.  A0067814 • **Are the resistances less than 5 ohms?**	**Yes** GO to O19 . **No** REPAIR the circuit in question. TEST the system for normal operation.
O19 CHECK JOINT CONNECTOR No. 4 FOR AN OPEN	
• Measure the resistance between joint connector No. 4 C223-14, component side and joint connector No. 4 C223-15, component side.	**Yes** REPAIR the circuit in question between the DLC C251 and joint connector No. 4 C223. CARRY OUT the

 A0004385 • Measure the resistance between joint connector No. 4 C223-8, component side and joint connector No. 4 C223-9, component side.  A0004388 • **Are the resistances less than 5 ohms?**	diagnostic tool data link test. **No** REPAIR joint connector No. 4 C223. TEST the system for normal operation.
O20 CHECK THE SCP NETWORK WITH THE DATC MODULE C228b DISCONNECTED	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: DATA LINK DIAGNOSTICS Test. • **Did the diagnostic tool indicate system passed?**	**Yes** GO to O79 . **No** GO to O21 .
O21 CHECK THE INSTRUMENT CLUSTER C220b FOR DAMAGE	
• Key In OFF position. • Connect: DATC module C228a. • Connect: Joint Connector No. 4 C223. • Disconnect: Instrument Cluster C220b. • Inspect the instrument cluster C220b for damage. • **Is the instrument cluster C220b OK?**	**Yes** GO to O22 . **No** REPAIR the instrument cluster C220b as necessary. TEST the system for normal operation.
O22 CHECK FOR AN OPEN BETWEEN THE DLC C251 AND THE INSTRUMENT CLUSTER C220b	
• Measure the resistance between the instrument cluster C220b-15, circuit 4-EG8 (GY/VT), harness side and the DLC C251-2, circuit 4-EG7 (GY/RD), harness side.  A0004371 • Measure the resistance between the instrument cluster C220b-16, circuit 5-EG8 (BU/WH), harness side and the DLC C251-10, circuit 5-EG7 (BU/RD), harness side.	**Yes** GO to O25 . **No** GO to O23 .

 A0004374 • **Is the resistance less than 5 ohms?**	
O23 CHECK FOR AN OPEN BETWEEN THE INSTRUMENT CLUSTER C220b AND JOINT CONNECTOR No. 4 C223	
• Disconnect: Joint Connector No. 4 C223. • Measure the resistance between instrument cluster C220b-15, circuit 4-EG8 (GY/VT), harness side and joint connector No. 4 C223-13, circuit 4-EG8 (GY/VT), harness side.  A0004372 • Measure the resistance between instrument cluster C220b-16, circuit 5-EG8 (BU/WH), harness side and joint connector No. 4 C223-10, circuit 5-EG8 (BU/WH), harness side.  A0067810 • **Is the resistance less than 5 ohms?**	**Yes** GO to O24 . **No** REPAIR the circuit in question. TEST the system for normal operation.
O24 CHECK JOINT CONNECTOR No. 4 FOR AN OPEN	
• Measure the resistance between joint connector No. 4 C223-13, component side and joint connector No. 4 C223-14, component side.  A0004373 • Measure the resistance between joint connector No. 4 C223-10, component side and joint connector No. 4 C223-9, component side.	**Yes** REPAIR the circuit in question between the DLC C251 and joint connector No. 4 C223. TEST the system for normal operation. **No** REPAIR joint connector No. 4 as necessary. TEST the system for normal operation.

 A0004376 • **Is the resistance less than 5 ohms?**	
O25 CHECK SCP NETWORK WITH THE INSTRUMENT CLUSTER C220b DISCONNECTED	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: DATA LINK DIAGNOSTICS Test. • **Did the diagnostic tool indicate system passed?**	**Yes** GO to O80 . **No** GO to O26 .
O26 CHECK THE NAVIGATION SYSTEM MODULE C4209 FOR DAMAGE	
• Key in OFF position. • Connect: Instrument Cluster C220b. • Connect: Joint Connector No. 4 C223. • Disconnect: Navigation System Module C4209. • Inspect the navigation system module C4209 for damage. • **Is the navigation system module C4209 OK?**	**Yes** GO to O27 . **No** REPAIR the navigation system module C4209 as necessary. TEST the system for normal operation.
O27 CHECK FOR AN OPEN BETWEEN THE DLC C251 AND THE NAVIGATION SYSTEM MODULE C4209	
• Measure the resistance between the navigation system module C4209-4, circuit 4-EG17 (GY/BK), harness side and the DLC C251-2, circuit 4-EG7 (GY/RD), harness side.  A0057786 • Measure the resistance between the navigation system module C4209-16, circuit 5-EG17 (BU/YE), harness side and the DLC C251-10, circuit 5-EG7 (BU/RD), harness side.  A0057787 • **Are the resistances less than 5 ohms?**	**Yes** GO to O34 . **No** GO to O28 .
O28 CHECK FOR AN OPEN BETWEEN JOINT CONNECTOR No. 5 C427 AND THE NAVIGATION SYSTEM MODULE C4209	

• Disconnect: Joint Connector No. 5 C427. • Measure the resistance between the navigation system module C4209-4, circuit 4-EG17 (GY/BK), harness side and joint connector No. 5 C427-4, circuit 4-EG17 (GY/BK), harness side.  A0067864 • Measure the resistance between the navigation system module C4209-16, circuit 5-EG17 (BU/YE), harness side and joint connector No. 5 C427-15, circuit 5-EG17 (BU/YE), harness side.  A0067865 • **Are the resistances less than 5 ohms?**	**Yes** GO to O29 . **No** REPAIR the circuit in question. TEST the system for normal operation.
O29 CHECK JOINT CONNECTOR No. 5 FOR AN OPEN	
• Measure the resistance between joint connector No. 5 C427-1, component side and joint connector No. 5 C427-4, component side.  A0067843 • Measure the resistance between joint connector No. 5 C427-12, component side and joint connector No. 5 C427-15, component side.  A0067844 • **Are the resistances less than 5 ohms?**	**Yes** GO to O30 . **No** REPAIR joint connector No. 5 C427 as necessary. TEST the system for normal operation.
O30 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283b AND JOINT CONNECTOR No. 5 C427	
• Disconnect: Interior AJB C283b. • Measure the resistance between the interior AJB C283b-8, circuit 4-EG1 (GY/RD), harness side and joint connector No. 5 C427-1, circuit 4-EG1 (GY/RD), harness side.	**Yes** GO to O31 . **No** REPAIR the circuit in

 A0067845 • Measure the resistance between the interior AJB C283b-4, circuit 5-EG1 (BU/RD), harness side and joint connector No. 5 C427-12, circuit 5-EG1 (BU/RD), harness side.  A0067846 • **Are the resistances less than 5 ohms?**	question. CARRY OUT the diagnostic tool data link test.
O31 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283b AND THE INTERIOR AJB C283d	
• Disconnect: Interior AJB C283d. • Measure the resistance between the interior AJB C283d-16, component side and the interior AJB C283b-8, component side.  A0057792 • Measure the resistance between the interior AJB C283d-12, component side and the interior AJB C283b-4, component side.  A0057793 • **Are the resistances less than 5 ohms?**	**Yes** GO to O32 . **No** INSTALL a new interior AJB. TEST the system for normal operation.
O32 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283d AND JOINT CONNECTOR No. 4 C223	
• Disconnect: Interior Joint Connector No. 4 C223. • Measure the resistance between the interior AJB C283d-16, circuit 4-EG1 (GY/RD), harness side and joint connector No. 4 C223-12, circuit 4-EG1 (GY/RD), harness side.	**Yes** GO to O33 . **No** REPAIR the circuit in question. CARRY OUT the diagnostic tool data link test.

 A0067847 • Measure the resistance between the interior AJB C283d-12, circuit 5-EG1 (BU/RD), harness side and joint connector No. 4 C223-11, circuit 5-EG1 (BU/RD), harness side.  A0067848 • **Are the resistances less than 5 ohms?**	
O33 CHECK JOINT CONNECTOR No. 4 FOR AN OPEN	
• Measure the resistance between joint connector No. 4 C223-12, component side and joint connector No. 4 C223-14, component side.  A0004357 • Measure the resistance between joint connector No. 4 C223-9, component side and joint connector No. 4 C223-11, component side.  A0004362 • **Are the resistances less than 5 ohms?**	**Yes** REPAIR the circuit in question between the DLC C251 and joint connector No. 4 C223. CARRY OUT the diagnostic tool data link test. **No** REPAIR joint connector No. 4 C223. TEST the system for normal operation.
O34 CHECK THE SCP NETWORK WITH THE NAVIGATION SYSTEM MODULE C4209 DISCONNECTED	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: DATA LINK DIAGNOSTICS Test. • **Did the diagnostic tool indicate system passed?**	**Yes** GO to O81 . **No** GO to O35 .
O35 CHECK THE ACM C240c FOR DAMAGE	
• Key in OFF position. • Connect: Navigation System Module C4209. • Connect: Interior AJB C283b and C283d.	**Yes** GO to O36 . **No**

• Connect: Joint Connector No. 5 C427. • Connect: Joint Connector No. 4 C223. • Disconnect: ACM C290c. • Inspect ACM C290c for damage. • **Is the ACM C290c OK?**	REPAIR the ACM C290c as necessary. TEST the system for normal operation.
O36 CHECK FOR AN OPEN BETWEEN THE DLC C251 AND THE ACM C240c	
• Measure the resistance between the ACM C290c-3, circuit 4-EG10 (GY/BK), harness side and the DLC C251-2, circuit 4-EG7 (GY/RD), harness side.  A0004389 • Measure the resistance between the ACM C290c-4, circuit 5-EG10 (BU/YE), harness side and the DLC C251-10, circuit 5-EG7 (BU/RD), harness side.  A0004392 • **Are the resistances less than 5 ohms?**	**Yes** GO to O39 . **No** GO to O37 .
O37 CHECK FOR AN OPEN BETWEEN THE ACM C240c AND JOINT CONNECTOR No. 4 C223	
• Disconnect: Joint Connector No. 4 C223. • Measure the resistance between the ACM C290c-3, circuit 4-EG10 (GY/BK), harness side and joint connector No. 4 C223-16, circuit 4-EG10 (GY/BK), harness side.  A0067815 • Measure the resistance between the ACM C290c-4, circuit 5-EG10 (BU/YE), harness side and joint connector No. 4 C223-7, circuit 5-EG10 (BU/YE), harness side.	**Yes** GO to O38 . **No** REPAIR the circuit in question. TEST the system for normal operation.

 A0067816 • **Are the resistances less than 5 ohms?**	
O38 CHECK JOINT CONNECTOR No. 4 FOR AN OPEN	
• Measure the resistance between joint connector No. 4 C223-16, component side and joint connector No. 4 C223-14, component side.  A0004391 • Measure the resistance between joint connector No. 4 C223-7, component side and joint connector No. 4 C223-9, component side.  A0004394 • **Are the resistances less than 5 ohms?**	**Yes** REPAIR the circuit in question between the DLC C251 and joint connector No. 4 C223. CARRY OUT the diagnostic tool data link test. **No** REPAIR joint connector No. 4 C223. TEST the system for normal operation.
O39 CHECK THE SCP NETWORK WITH THE ACM C240c DISCONNECTED	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: DATA LINK DIAGNOSTICS Test. • **Did the diagnostic tool indicate system passed?**	**Yes** GO to O82 . **No** GO to O40 .
O40 CHECK THE REM C420b FOR DAMAGE	
• Key in OFF position. • Connect: ACM C290c. • Connect: Joint Connector No. 4 C223. • Disconnect: REM C420b. • Inspect the REM C420b for damage. • **Is the REM C420b OK?**	**Yes** GO to O41 . **No** REPAIR the REM C420b as necessary. TEST the system for normal operation.
O41 CHECK FOR AN OPEN BETWEEN THE DLC C251 AND THE REM C420b	
• Measure the resistance between the REM C420b-1, circuit 4-EG12 (GY/WH), harness side and the DLC C251-2, circuit 4-EG7 (GY/RD), harness side.	**Yes** GO to O46 . **No** GO to O42 .

 A0004423 • Measure the resistance between the REM C420b-2, circuit 5-EG12 (BU/OG), harness side and the DLC C251-10, circuit 5-EG7 (BU/RD), harness side.  A0004426 • **Are the resistances less than 5 ohms?**	
O42 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283b AND THE REM C420b	
• Disconnect: Interior AJB C283b. • Measure the resistance between the REM C420b-1, circuit 4-EG12 (GY/WH), harness side and the interior AJB C283b-16, circuit 4-EG11 (GY), harness side.  A0004424 • Measure the resistance between the REM C420b-2, circuit 5-EG12 (BU/OG), harness side and the interior AJB C283b-12, circuit 5-EG11 (BU), harness side.  A0004427 • **Are the resistances less than 5 ohms?**	**Yes** GO to O43 . **No** REPAIR the circuit in question. TEST the system for normal operation.
O43 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283b AND THE INTERIOR AJB C283d	
• Disconnect: Interior AJB C283d. • Measure the resistance between the interior AJB C283d-16, component side and the interior AJB C283b-16, component side.	**Yes** GO to O44 . **No** INSTALL a new AJB. TEST the system for normal operation.

 A0004425 • Measure the resistance between the interior AJB C283d-12, component side and the interior AJB C283b-12, component side.  A0004428 • **Are the resistances less than 5 ohms?**	
O44 CHECK FOR AN OPEN BETWEEN INTERIOR AJB C283d AND JOINT CONNECTOR No. 4 C223	
• Disconnect: Interior Joint Connector No. 4 C223. • Measure the resistance between interior the AJB C283d-16, circuit 4-EG1 (GY/RD), harness side and joint connector No. 4 C223-12, circuit 4-EG1 (GY/RD), harness side.  A0067841 • Measure the resistance between the interior AJB C283d-12, circuit 5-EG1 (BU/RD), harness side and joint connector No. 4 C223-11, circuit 5-EG1 (BU/RD), harness side.  A0067842 • **Are the resistances less than 5 ohms?**	**Yes** GO to O45 . **No** REPAIR the circuit in question. CARRY OUT the diagnostic tool data link test.
O45 CHECK JOINT CONNECTOR No. 4 FOR AN OPEN	
• Measure the resistance between joint connector No. 4 C223-12, component side and joint connector No. 4 C223-14, component side.  A0004357	**Yes** REPAIR the circuit in question between the DLC C251 and joint connector No. 4 C223. CARRY OUT the diagnostic tool data link test. **No** REPAIR joint connector No. 4 C223. TEST the system for normal operation.

• Measure the resistance between joint connector No. 4 C223-9, component side and joint connector No. 4 C223-11, component side.  A0004362 • **Are the resistances less than 5 ohms?**	
O46 CHECK THE SCP NETWORK WITH THE REM C420b DISCONNECTED	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: DATA LINK DIAGNOSTICS Test. • **Did the diagnostic tool indicate system passed?**	**Yes** GO to O83 . **No** GO to O47 .
O47 CHECK THE FEM C201c FOR DAMAGE	
• Key in OFF position. • Connect: REM C420b. • Connect: Interior AJB C283b and C283d. • Connect: Joint Connector No. 4 C223. • Disconnect: the FEM C201c. • Inspect the FEM C201c for damage; repair as necessary. • **Is the FEM C201c OK?**	**Yes** GO to O48 . **No** REPAIR the FEM C201c as necessary. TEST the system for normal operation.
O48 CHECK FOR AN OPEN BETWEEN THE DLC C251 AND THE FEM C201c	
• Measure the resistance between the FEM C201c-7, circuit 4-EG11 (GY), harness side and the DLC C251-2, circuit 4-EG7 (GY/RD), harness side.  A0004363 • Measure the resistance between the FEM C201c-1, circuit 5-EG11 (BU), harness side and the DLC C251-10, circuit 5-EG7 (BU/RD), harness side.  A0004366 • **Is the resistance less than 5 ohms?**	**Yes** GO to O58 . **No** GO to O49 .

O49 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283c AND THE FEM C201c	
• Disconnect: Interior ABJ C283c. • Measure the resistance between the FEM C201c-7, circuit 4-EG11 (GY), harness side and the interior AJB C283c-10, circuit 4-EG11 (GY), harness side.  A0004364 • Measure the resistance between the FEM C201c-1, circuit 5-EG11 (BU), harness side and the interior AJB C283c-8, circuit 5-EG11 (BU), harness side.  A0004367 • **Is the resistance less than 5 ohms?**	**Yes** GO to O50 . **No** REPAIR the circuit in question. TEST the system for normal operation.
O50 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283c AND THE INTERIOR AJB C283d	
• Disconnect: Interior AJB C283d. • Measure the resistance between the interior AJB C283d-16, component side and the interior AJB C283c-10, component side.  A0004365 • Measure the resistance between the interior AJB C283d-12, component side and the interior AJB C283c-8, component side.  A0004368 • **Are the resistances less than 5 ohms?**	**Yes** GO to O51 . **No** INSTALL a new AJB. TEST the system for normal operation.
O51 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283d AND JOINT CONNECTOR No. 4 C223	

• Disconnect: Interior Joint Connector No. 4 C223. • Measure the resistance between the interior AJB C283d-16, circuit 4-EG1 (GY/RD), harness side and joint connector No. 4 C223-11, circuit 4-EG1 (GY/RD), harness side.  A0067841 • Measure the resistance between the interior AJB C283d-12, circuit 5-EG1 (BU/RD), harness side and joint connector No. 4 C223-12, circuit 5-EG1 (BU/RD), harness side.  A0067842 • **Are the resistances less than 5 ohms?**	**Yes** GO to O52 . **No** REPAIR the circuit in question. CARRY OUT the diagnostic tool data link test.
O52 CHECK JOINT CONNECTOR No. 4 FOR AN OPEN	
• Measure the resistance between joint connector No. 4 C223-12, component side and joint connector No. 4 C223-14, component side.  A0004357 • Measure the resistance between joint connector No. 4 C223-11, component side and joint connector No. 4 C223-9, component side.  A0004362 • **Are the resistances less than 5 ohms?**	**Yes** REPAIR the circuit in question between the DLC C251 and joint connector No. 4 C223. CARRY OUT the diagnostic tool data link test. **No** REPAIR joint connector No. 4 C223. TEST the system for normal operation.
O53 CHECK THE SCP NETWORK WITH THE FEM C201c DISCONNECTED	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: DATA LINK DIAGNOSTICS Test. • **Did the diagnostic tool indicate system passed?**	**Yes** GO to O84 . **No** GO to O54 .

O54 CHECK THE ELECTRONIC PARKING BRAKE MODULE C4205b FOR DAMAGE	
• Key in OFF position. • Connect: FEM C201c. • Connect: Interior AJB C283c and C283d. • Connect: Joint Connector No. 4 C223. • Disconnect: Electronic Parking Brake Module C4205b. • Inspect the electronic parking brake module C4205b for damage. • **Is the electronic parking brake module C4205b OK?**	**Yes** GO to O55 . **No** REPAIR the electronic parking brake module C4205b as necessary. TEST the system for normal operation.
O55 CHECK FOR AN OPEN BETWEEN THE DLC C251 AND THE ELECTRONIC PARKING BRAKE MODULE C4205b	
• Measure the resistance between the electronic parking brake module C4205b-1, circuit 4-CG16 (GY/RD), harness side and the DLC C251-2, circuit 4-EG7 (GY/RD), harness side.  A0057805 • Measure the resistance between the electronic parking brake module C4205b-7, circuit 5-CG16 (BU/RD), harness side and the DLC C251-10, circuit 5-EG7 (BU/RD), harness side.  A0057810 • **Are the resistances less than 5 ohms?**	**Yes** GO to O62 . **No** GO to O56 .
O56 CHECK FOR AN OPEN BETWEEN JOINT CONNECTOR No. 5 C427 AND THE ELECTRONIC PARKING BRAKE MODULE C4205b	
• Disconnect: Joint Connector No. 5 C427. • Measure the resistance between the electronic parking brake module C4205b-1, circuit 4-CG16 (GY/RD), harness side and joint connector No. 5 C427-2, circuit 4-CG16 (GY/RD), harness side.  A0067866	**Yes** GO to O57 . **No** REPAIR the circuit in question. TEST the system for normal operation.

• Measure the resistance between the electronic parking brake module C4205b-7, circuit 5-CG16 (BU/RD), harness side and joint connector No. 5 C427-13, circuit 5-CG16 (BU/RD), harness side.  A0067867 • **Are the resistances less than 5 ohms?**	
O57 CHECK JOINT CONNECTOR No. 5 FOR AN OPEN	
• Measure the resistance between joint connector No. 5 C427-1, component side and joint connector No. 5 C427-2, component side.  A0067868 • Measure the resistance between joint connector No. 5 C427-12, component side and joint connector No. 5 C427-13, component side.  A0067869 • **Are the resistances less than 5 ohms?**	**Yes** GO to O58 . **No** REPAIR joint connector No. 5 C427 as necessary. TEST the system for normal operation.
O58 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283b AND JOINT CONNECTOR No. 5 C427	
• Disconnect: Interior Joint Connector No. 4 C283b. • Measure the resistance between the interior AJB C283b-8, circuit 4-EG1 (GY/RD), harness side and joint connector No. 5 C427-1, circuit 4-EG1 (GY/RD), harness side.  A0067870 • Measure the resistance between the interior AJB C283b-4, circuit 5-EG1 (BU/RD), harness side and joint connector No. 5 C427-12, circuit 5-EG1 (BU/RD), harness side.	**Yes** GO to O59 . **No** REPAIR the circuit in question. CARRY OUT the diagnostic tool data link test.

 A0067871 • **Are the resistances less than 5 ohms?**	
O59 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283b AND THE INTERIOR AJB C283d	
• Disconnect: Interior AJB C283d. • Measure the resistance between the interior AJB C283d-16, component side and the interior AJB C283b-8, component side.  A0057792 • Measure the resistance between the interior AJB C283d-12, component side and the interior AJB C283b-4, component side.  A0057793 • **Are the resistances less than 5 ohms?**	**Yes** GO to O60 . **No** INSTALL a new interior AJB. TEST the system for normal operation.
O60 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283d AND JOINT CONNECTOR No. 4 C223	
• Disconnect: Interior Joint Connector No. 4 C223. • Measure the resistance between the interior AJB C283d-16, circuit 4-EG1 (GY/RD), harness side and joint connector No. 4 C223-12, circuit 4-EG1 (GY/RD), harness side.  A0067872 • Measure the resistance between the interior AJB C283d-12, circuit 5-EG1 (BU/RD), harness side and joint connector No. 4 C223-11, circuit 5-EG1 (BU/RD), harness side.	**Yes** GO to O61 . **No** REPAIR the circuit in question. CARRY OUT the diagnostic tool data link test.

 A0067887 • **Are the resistances less than 5 ohms?**	
O61 CHECK JOINT CONNECTOR No. 4 FOR AN OPEN	
• Measure the resistance between joint connector No. 4 C223-12, component side and joint connector No. 4 C223-14, component side.  A0004357 • Measure the resistance between joint connector No. 4 C223-9, component side and joint connector No. 4 C223-11, component side.  A0004362 • **Are the resistances less than 5 ohms?**	**Yes** REPAIR the circuit in question between the DLC C251 and joint connector No. 4 C223. CARRY OUT the diagnostic tool data link test. **No** REPAIR joint connector No. 4 C223. TEST the system for normal operation.
O62 CHECK THE SCP NETWORK WITH THE ELECTRONIC PARKING BRAKE C4205b DISCONNECTED	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: DATA LINK DIAGNOSTICS Test. • **Did the diagnostic tool indicate system passed?**	**Yes** GO to O85 . **No** GO to O63 .
O63 CHECK THE DSM C341c FOR DAMAGE	
• Key in OFF position. • Connect: Electronic Parking Brake Module C4205b. • Connect: Interior AJB C283b, C283c. • Connect: Joint Connector No. 4 C223. • Connect: Joint Connector No. 5 C427. • Disconnect: DSM C341c. • Inspect the DSM C341c for damage. • **Is the DSM C341c OK?**	**Yes** GO to O64 . **No** REPAIR the DSM C341c as necessary. TEST the system for normal operation.
O64 CHECK FOR AN OPEN BETWEEN THE DLC C251 AND THE DSM 341c	

• Measure the resistance between the DSM C341c-1, circuit 4-AH80 (GY/WH), harness side and the DLC C251-2, circuit 4-EG7 (GY/RD), harness side.  A0004409 • Measure the resistance between the DSM C341c-9, circuit 5-AH80 (BU/OG), harness side and the DLC C251-10, circuit 5-EG7 (BU/RD), harness side.  A0004413 • **Are the resistances less than 5 ohms?**	**Yes** GO to O69 . **No** GO to O65 .
O65 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283a AND THE DSM 341c	
• Disconnect: Interior AJB C283a. • Measure the resistance between the DSM C341c-1, circuit 4-AH80 (GY/WH), harness side and the interior AJB C283a-16, circuit 4-AH80 (GY/WH), harness side.  A0067951 • Measure the resistance between the DSM C341c-9, circuit 5-AH80 (BU/OG), harness side and the interior AJB C283a-12, circuit 5-AH80 (BU/OG), harness side.  A0004414 • **Are the resistances less than 5 ohms?**	**Yes** GO to O66 . **No** Repair the circuit in question. TEST the system for normal operation.
O66 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283a AND THE INTERIOR AJB C283d	

• Disconnect: Interior AJB C283d. • Measure the resistance between the interior AJB C283a-16, component side and the interior AJB C283d-16, component side.  A0004412 • Measure the resistance between the interior AJB C283a-12, component side and the interior AJB C283d-12, component side.  A0004416 • **Are the resistances less than 5 ohms?**	**Yes** GO to O67 . **No** INSTALL a new interior AJB. TEST the system for normal operation.
O67 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283d AND JOINT CONNECTOR No. 4 C223	
• Disconnect: Interior Joint Connector No. 4 C223. • Measure the resistance between the interior AJB C283d-16, circuit 4-EG1 (GY/RD), harness side and joint connector No. 4 C223-12, circuit 4-EG1 (GY/RD), harness side.  A0067811 • Measure the resistance between the interior AJB C283d-12, circuit 5-EG1 (BU/RD), harness side and joint connector No. 4 C223-11, circuit 5-EG1 (BU/RD), harness side.  A0067812 • **Are the resistances less than 5 ohms?**	**Yes** GO to O68 . **No** REPAIR the circuit in question. CARRY OUT the diagnostic tool data link test.
O68 CHECK JOINT CONNECTOR No. 4 FOR AN OPEN	
• Measure the resistance between joint connector No. 4 C223-12, component side and joint connector No. 4 C223-14, component side.	**Yes** REPAIR the circuit in question between the DLC C251 and joint connector No. 4 C223. CARRY OUT the diagnostic tool data link test.

 A0004357 • Measure the resistance between joint connector No. 4 C223-9, component side and joint connector No. 4 C223-11, component side.  A0004362 • **Are the resistances less than 5 ohms?**	**No** REPAIR joint connector No. 4 C223. TEST the system for normal operation.
O69 CHECK THE SCP NETWORK WITH THE DSM C341c DISCONNECTED	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: DATA LINK DIAGNOSTICS Test. • **Did the diagnostic tool indicate system passed?**	**Yes** GO to O86 . **No** GO to O70 .
O70 CHECK THE DDM C501a FOR DAMAGE	
• Key in OFF position. • Connect: DSM C341c. • Connect: In-line C315. • Connect: Interior AJB C283a, C283c. • Connect: Joint Connector No. 4 C223. • Disconnect: DDM C501a. • Inspect the DDM C501a for damage. • **Is the DDM C501a OK?**	**Yes** GO to O71 . **No** REPAIR the DDM C501a as necessary. TEST the system for normal operation.
O71 CHECK FOR AN OPEN BETWEEN THE DLC C251 AND THE DDM C501a	
• Measure the resistance between the DDM 501a-3, circuit 4-EG13 (GY/OG), harness side and the DLC C251-2, circuit 4-EG7 (GY/RD), harness side.  A0004417 • Measure the resistance between the DDM 501a-4, circuit 5-EG13 (BU/BK), harness side and the DLC C251-10, circuit 5-EG7 (BU/RD), harness side.	**Yes** GO to O76 . **No** GO to O72 .

 A0004420 • **Are the resistances less than 5 ohms?**	
O72 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283a AND THE DDM C501a	
• Disconnect: Interior AJB C283a. • Measure the resistance between the DDM 501a-3, circuit 4-EG13 (GY/OG), harness side and the interior AJB C283a-8, circuit 4-EG13 (GY/OG), harness side.  A0004418 • Measure the resistance between the DDM 501a-4, circuit 5-EG13 (BU/BK), harness side and the interior AJB C283a-4, circuit 5-EG13 (BU/BK), harness side.  A0004421 • **Are the resistances less than 5 ohms?**	**Yes** GO to O73 . **No** REPAIR the circuit in question. TEST the system for normal operation.
O73 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283a AND THE INTERIOR AJB C283d	
• Disconnect: Interior AJB C283d. • Measure the resistance between the interior AJB C283d-16, component side and the interior AJB C283a-8, component side.  A0004419 • Measure the resistance between the interior AJB C283d-12, component side and the interior AJB C283a-4, component side.	**Yes** GO to O74 . **No** INSTALL a new AJB. TEST the system for normal operation.

 A0004422 • **Are the resistances less than 5 ohms?**	
O74 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283d AND JOINT CONNECTOR No. 4 C223	
• Disconnect: Joint Connector No. 4 C223. • Measure the resistance between the interior AJB C283d-16, circuit 4-EG1 (GY/RD), harness side and joint connector No. 4 C223-12, circuit 4-EG1 (GY/RD), harness side.  A0067811 • Measure the resistance between the interior AJB C283d-12, circuit 5-EG1 (BU/RD), harness side and joint connector No. 4 C223-11, circuit 5-EG1 (BU/RD), harness side.  A0067812 • **Are the resistances less than 5 ohms?**	**Yes** GO to O75 . **No** REPAIR the circuit in question. TEST the system for normal operation.
O75 CHECK JOINT CONNECTOR No. 4 FOR AN OPEN	
• Measure the resistance between joint connector No. 4 C223-12, component side and joint connector No. 4 C223-14, component side.  A0004357 • Measure the resistance between joint connector No. 4 C223-9, component side and joint connector No. 4 C223-11, component side.	**Yes** REPAIR the circuit in question between the DLC C251 and joint connector No. 4 C223. CARRY OUT the diagnostic tool data link test. **No** REPAIR joint connector No. 4 C223. TEST the system for normal operation.

 • **Are the resistances less than 5 ohms?**	
O76 CHECK THE SCP NETWORK WITH THE DDM C501a DISCONNECTED	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: DATA LINK DIAGNOSTICS Test. • **Did the diagnostic tool indicate system passed?**	**Yes** GO to O87 . **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
O77 CHECK FOR CORRECT PCM OPERATION	

• Disconnect all the PCM connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-04A or Section 303-04B . TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

O78 CHECK FOR CORRECT ABS/TC CONTROL MODULE OR STABILITY ASSIST MODULE OPERATION	

• Disconnect all the ABS/TC or stability assist module connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the ABS/TC or stability assist control module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ABS/TC module or stability assist module. REFER to Section 206-09 . TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No
	The system is operating correctly at this time. Concern may have been

	caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
O79 CHECK FOR CORRECT DATC OPERATION	

• Disconnect all the DATC connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the DATC connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new DATC module. REFER to Section 412-00 . TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

O80 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-00 . TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

O81 CHECK FOR CORRECT NAVIGATION SYSTEM MODULE OPERATION	

• Disconnect all the navigation system module connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the navigation system module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new navigation system module. REFER to Section 419-02 . TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No
	The system is operating correctly at this time. Concern may have been

	caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
O82 CHECK FOR CORRECT ACM OPERATION	

• Disconnect all the ACM connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the ACM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new ACM. REFER to Section 415-00 . TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

O83 CHECK FOR CORRECT REM OPERATION	

• Disconnect all the REM connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the REM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new REM. REFER to Rear Electronic Module (REM) in this section. TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

O84 CHECK FOR CORRECT FEM OPERATION	

• Disconnect all the FEM connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the FEM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new FEM. REFER to Front Electronic Module (FEM) in this section. TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No
	The system is operating correctly at this time. Concern may have been

	caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
O85 CHECK FOR CORRECT ELECTRONIC PARKING BRAKE MODULE OPERATION	

• Disconnect all the electronic parking brake module connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the electric parking brake module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new electronic parking brake module. REFER to Section 206-00 . TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

O86 CHECK FOR CORRECT DSM OPERATION	

• Disconnect all the DSM connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the DSM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new DSM. REFER to Driver Seat Module (DSM) in this section. TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

O87 CHECK FOR CORRECT DDM OPERATION	

• Disconnect all the DDM connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the DDM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new DDM. REFER to Driver Door Module (DDM) in this section. TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No
	The system is operating

	correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test P: No International Standards Organization (ISO) 9141 Network Communication

Refer to Wiring Diagrams Cell 14 for schematic and connector information.

Normal Operation

The RCM communicates with the diagnostic tool through the ISO 9141 communications network circuit 4-EE1 (GY/RD). If circuit 4-EE1 (GY/RD) becomes open or shorted to ground, communications to that module will not be possible. Check circuit 4-EE1 (GY/RD) between the RCM C310a and the DLC C251. Total resistance values must not be more than 5 ohms. If the resistance is more than 5 ohms, there is either an open in circuit 4-EE1 (GY/RD), damage to the DLC C251, in-line C212 or damage to the C310a.

Possible Causes

- circuit 4-EE1 (GY/RD) shorted to ground or open
- in-line C212
- RCM C310a
- DLC C251
- RCM

PINPOINT TEST P: NO INTERNATIONAL STANDARDS ORGANIZATION (ISO) 9141 NETWORK COMMUNICATION

Test Step	Result / Action to Take
P1 CHECK THE DLC C251 FOR DAMAGE	
• Key in OFF position. • Inspect the DLC C251. • **Is the DLC C251 OK?**	**Yes** GO to P2 . **No** REPAIR the DLC C251. CARRY OUT the diagnostic tool data link test.
P2 CHECK FOR AN OPEN CIRCUIT BETWEEN THE RCM C310a AND THE DLC C251	
• Deactivate the air bag system. Refer to Section 501-20B . • Disconnect: RCM C310b. • Inspect the RCM C310b for damage. • **Is the RCM C310 OK?**	**Yes** GO to P3 . **No** REPAIR the RCM C310b as necessary. TEST the system for normal operation.
P3 CHECK FOR AN OPEN CIRCUIT BETWEEN THE RCM C310a AND THE DLC C251	
• Measure the resistance between the DLC C251-7, circuit 4-EE10 (GY/BK), harness side and the RCM C310b-11, circuit 4-EE1 (GY/RD), harness side.	**Yes** GO to P5 . **No** GO to P4 .

 A0057570 • **Is the resistance less than 5 ohms?**	
P4 CHECK FOR AN OPEN CIRCUIT BETWEEN DLC C251 AND IN-LINE C212M	
• Disconnect: in-line C212. • Measure the resistance between the DLC C251-7, circuit 4-EE10 (GY/BK), harness side and in-line C212F-8, circuit 4-EE10 (GY/BK), harness side.  A0004370 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit between the RCM C310b and in-line C212M. TEST the system for normal operation. **No** REPAIR the circuit between the DLC C251 and in-line C212F. TEST the system for normal operation.
P5 CHECK THE ISO 9141 NETWORK WITH THE RCM C310a DISCONNECTED	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: DATA LINK DIAGNOSTICS Test. • **Did the diagnostic tool indicate system passed?**	**Yes** GO to P6 . **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
P6 CHECK FOR CORRECT RCM OPERATION	

• Disconnect all the RCM connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the RCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new RCM. REFER to Section 501-20B . TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test Q: No Universal Asynchronous Recieve-Transmit (UART) Based Protocol (UBP) Network Communication

Refer to Wiring Diagrams Cell 14 for schematic and connector information.

Normal Operation

The driver climate control seat module, passenger climate control seat module and parking aid module communicate with the diagnostic tool through the UART based-protocol (UBP) communications network circuit 4-ED6 (OG). If circuit 4-ED6 (OG) becomes open or shorted to ground, communications to that module will not be possible. Check circuit 4-ED6 (OG) between the driver climate control seat module, passenger climate control seat module, parking aid module and the DLC C251. Total resistance values must not be more than 5 ohms. If the resistance is more than 5 ohms, there is either an open in circuit 4-ED6 (OG), damage to the DLC C251 or damage to the driver or passenger climate control seat module, parking aid module, or a problem in one of the in-line connectors C213 or joint connector No. 1 C261. If, after individual checks of each circuit leading to a module show resistance values less than 5 ohms and no in-line connector issues are present, the data link diagnostics test must be run with the module in question disconnected. If the data links diagnostics test passes with the module in question disconnected, it is the source of the concern and should be removed and a new module installed.

Possible Causes

- DLC C251
- diagnostic tool
- in-line C213
- in-line C313
- in-line C315
- joint connector No. 1 C261
- 4-ED6 (OG)
- driver climate control seat module
- passenger climate control seat module
- parking aid module

PINPOINT TEST Q: NO UNIVERSAL ASYNCHRONOUS RECIEVE-TRANSMIT (UART) BASED PROTOCOL (UBP) NETWORK COMMUNICATION

Test Step	Result / Action to Take
Q1 CHECK THE DRIVER TEMPERATURE CONTROLLED SEAT MODULE C3031a FOR DAMAGE	
• Key in OFF position. • Disconnect: driver temperature controlled seat module C3031a. • Inspect the driver temperature controlled seat module C3031a for damage. • **Is the driver temperature controlled seat module C3031a OK?**	**Yes** GO to Q2 . **No** REPAIR the driver temperature controlled seat module C3031a. CARRY OUT the diagnostic tool data link test.
Q2 CHECK CIRCUIT 4-HC21 (GY/OG) BETWEEN THE DLC C251 AND THE DRIVER TEMPERATURE CONTROLLED SEAT MODULE C3031a FOR AN OPEN	
• Measure the resistance between the driver temperature controlled seat module C3031a-1, circuit 4-HC21 (GY/OG), harness side and the DLC C251-3, circuit 4-ED6 (GY), harness side.	**Yes** GO to Q9 . **No** GO to Q3 .

 A0057798 • **Is the resistance less than 5 ohms?**	
Q3 CHECK IN-LINE C315 FOR DAMAGE	
• Disconnect: In-Line C315. • Inspect in-lines C315M and C315F for damage. • **Are in-lines C315M and C315F OK?**	**Yes** GO to Q4 . **No** REPAIR in-lines C315M and C315F. CARRY OUT the diagnostic tool data link test.
Q4 CHECK CIRCUIT 4-HC21 (GY/OG) BETWEEN IN-LINE C315F AND THE DRIVER TEMPERATURE CONTROLLED SEAT MODULE C3031a FOR AN OPEN	
• Measure the resistance between the driver temperature controlled seat module C3031a-1, circuit 4-HC21 (GY/OG), harness side and in-line C315M-10, circuit 4-HC21 (GY/OG), harness side.  A0057799 • **Is the resistance less than 5 ohms?**	**Yes** GO to Q5 . **No** REPAIR the circuit between in-line C315M and the driver temperature controlled seat module C3031a. CARRY OUT the diagnostic tool data link test.
Q5 CHECK IN-LINE C213 FOR DAMAGE	
• Disconnect: In-Line C213. • Inspect in-lines C213M and C213F for damage. • **Are in-lines C213M and C213FOK?**	**Yes** GO to Q6 . **No** REPAIR in-lines C213M and C213F. CARRY OUT the diagnostic tool data link test.
Q6 CHECK CIRCUIT 4-HC21 (GY/OG) BETWEEN IN-LINE C315F AND IN-LINE C213F FOR AN OPEN	
• Measure the resistance between in-line C213F-11, circuit 4-HC1 (GY/RD), harness side and in-line C315M-10, circuit 4-HC21 (GY/OG), harness side.  A0057800 • **Is the resistance less than 5 ohms?**	**Yes** GO to Q7 . **No** REPAIR the circuit between in-line C315F and in-line C213. CARRY OUT the diagnostic tool data link test.

Q7 CHECK CIRCUIT 4-HC1 (GY/RD) BETWEEN IN-LINE C213M AND JOINT CONNECTOR No. 1 C261 FOR AN OPEN	
• Measure the resistance between in-line C213M-11, circuit 4-HC1 (GY/RD), harness side and joint connector No. 1 C261-11, circuit 4-HC1 (GY/RD), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to Q8 . **No** REPAIR the circuit between in-line C213M and joint connector No. 1 C261. CARRY OUT the diagnostic tool data link test.
Q8 CHECK JOINT CONNECTOR No. 1 FOR AN OPEN	
• Measure the resistance between joint connector No. 1 C261-10, component side and joint connector No. 1 C261-11, component side.  • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit between joint connector No. 1 C261 and the DLC C251. CARRY OUT the diagnostic tool data link test. **No** REPAIR joint connector No. 1 C261 as necessary. CARRY OUT the diagnostic tool data link test.
Q9 CHECK THE UBP NETWORK WITH THE DRIVER CLIMATE CONTROL SEAT MODULE DISCONNECTED	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: DATA LINK DIAGNOSTICS Test. • **Did the diagnostic tool indicate system passed?**	**Yes** GO to Q26 . **No** GO to Q10 .
Q10 CHECK THE PASSENGER TEMPERATURE CONTROLLED SEAT MODULE C3036a FOR DAMAGE	
• Key in OFF position. • Connect: Driver Climate Control Seat Module C3031a. • Connect: In-line C315. • Connect: In-line C213. • Connect: Joint Connector No. 1 C261. • Disconnect: passenger temperature controlled seat module C3036a. • Inspect the passenger temperature controlled seat module C3036a for damage. • **Is the passenger temperature controlled seat module C3036a OK?**	**Yes** GO to Q11 . **No** REPAIR the passenger temperature controlled seat module C3036a. CARRY OUT the diagnostic tool data link test.
Q11 CHECK CIRCUIT 4-HC22 (GY) BETWEEN THE DLC C251 AND THE PASSENGER TEMPERATURE CONTROLLED SEAT MODULE C3036a FOR AN OPEN	

• Measure the resistance between the passenger temperature controlled seat module C3036a-1, circuit 4-HC22 (GY), harness side and the DLC C251-3, circuit 4-ED6 (GY), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to Q18 . **No** GO to Q12 .
Q12 CHECK IN-LINE C313 FOR DAMAGE	
• Disconnect: In-Line C313. • Inspect in-lines C313M and C313F for damage. • **Are in-lines C313M and C313F OK?**	**Yes** GO to Q13 . **No** REPAIR in-lines C313M and C313F. CARRY OUT the diagnostic tool data link test.
Q13 CHECK CIRCUIT 4-HC22 (GY) BETWEEN IN-LINE C313F AND THE PASSENGER TEMPERATURE CONTROLLED SEAT MODULE C3036a FOR AN OPEN	
• Measure the resistance between the passenger temperature controlled seat module C3036a-1, circuit 4-HC22 (GY), harness side and in-line C313M-10, circuit 4-HC22 (GY), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to Q14 . **No** REPAIR the circuit between in-line C313M and the passenger temperature controlled seat module C3036a. CARRY OUT the diagnostic tool data link test.
Q14 CHECK IN-LINE C213 FOR DAMAGE	
• Disconnect: In-Line C213. • Inspect in-lines C213M and C213F for damage. • **Are in-lines C213M and C213F OK?**	**Yes** GO to Q15 . **No** REPAIR in-lines C213M and C213F. CARRY OUT the diagnostic tool data link test.
Q15 CHECK CIRCUIT 4-HC22 (GY) BETWEEN IN-LINE C313F AND IN-LINE C213F FOR AN OPEN	
• Measure the resistance between in-line C213F-11, circuit 4-HC1 (GY/RD), harness side and in-line C313F-10, circuit 4-HC22 (GY), harness side.	**Yes** GO to Q16 . **No** REPAIR the circuit between in-line C313F and in-line C213F. CARRY

 A0057803 • **Is the resistance less than 5 ohms?**	OUT the diagnostic tool data link test.
Q16 CHECK CIRCUIT 4-HC1 (GY/RD) BETWEEN IN-LINE C213M AND JOINT CONNECTOR No. 1 C261 FOR AN OPEN	
• Measure the resistance between in-line C213M-11, circuit 4-HC1 (GY/RD), harness side and joint connector No. 1 C261-11, circuit 4-HC1 (GY/RD), harness side.  A0067863 • **Is the resistance less than 5 ohms?**	**Yes** GO to Q17 . **No** REPAIR the circuit between in-line C213M and joint connector No. 1 C261. CARRY OUT the diagnostic tool data link test.
Q17 CHECK JOINT CONNECTOR No. 1 FOR AN OPEN	
• Measure the resistance between joint connector No. 1 C261-10, component side and joint connector No. 1 C261-11, component side.  A0067850 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit between joint connector No. 1 C261 and the DLC C251. CARRY OUT the diagnostic tool data link test. **No** REPAIR joint connector No. 1 C261 as necessary. CARRY OUT the diagnostic tool data link test.
Q18 CHECK THE UBP NETWORK WITH THE PASSENGER CLIMATE CONTROL SEAT MODULE DISCONNECTED	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: DATA LINK DIAGNOSTICS Test. • **Did the diagnostic tool indicate system passed?**	**Yes** GO to Q27 . **No** GO to Q19 .
Q19 CHECK THE PARKING AID MODULE C4014b FOR DAMAGE	
• Key in OFF position. • Connect: Passenger Climate Control Seat Module C3036a. • Connect: In-line C313. • Connect: In-line C213. • Connect: Joint Connector No. 1 C261. • Disconnect: Parking Aid Module C4014b.	**Yes** GO to Q20 . **No** REPAIR the parking aid module C4014b. CARRY OUT the diagnostic tool data link test.

• Inspect the parking aid module C4014b for damage. • **Is the parking aid module C4014 OK?**	
Q20 CHECK CIRCUIT 4-GN10 (GY) BETWEEN THE DLC C251 AND THE PARKING AID MODULE C4014b FOR AN OPEN	
• Measure the resistance between the parking aid module C4014b-1, circuit 4-GN10 (GY), harness side and the DLC C251-3, circuit 4-ED6 (GY), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to Q25 . **No** GO to Q21 .
Q21 CHECK IN-LINE C213 FOR DAMAGE	
• Disconnect: In-Line C213. • Inspect in-lines C213M and C213F for damage. • **Are in-lines C213M and C213F OK?**	**Yes** GO to Q22 . **No** REPAIR in-lines C213M and C213F. CARRY OUT the diagnostic tool data link test.
Q22 CHECK CIRCUIT 4-GN10 (GY) BETWEEN THE PARKING AID MODULE C4014b AND IN-LINE C213F FOR AN OPEN	
• Measure the resistance between in-line C213F-11, circuit 4-HC1 (GY/RD), harness side and the parking aid module C4014b-1, circuit 4-GN10 (GY), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to Q23 . **No** REPAIR the circuit between the parking aid module C4014b and in-line C213F. CARRY OUT the diagnostic tool data link test.
Q23 CHECK CIRCUIT 4-HC1 (GY/RD) BETWEEN IN-LINE C213M AND JOINT CONNECTOR No. 1 C261 FOR AN OPEN	
• Measure the resistance between in-line C213M-11, circuit 4-HC1 (GY/RD), harness side and joint connector No. 1 C261-11, circuit 4-HC1 (GY/RD), harness side.	**Yes** GO to Q24 . **No** REPAIR the circuit between in-line C213M and joint connector No. 1 C261. CARRY OUT the diagnostic tool data link test.

 A0067849 • **Is the resistance less than 5 ohms?**	
Q24 CHECK JOINT CONNECTOR No. 1 FOR AN OPEN	
• Measure the resistance between joint connector No. 1 C261-10, component side and joint connector No. 1 C261-11, component side.  A0067850 • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit between joint connector No. 1 C261 and the DLC C251. CARRY OUT the diagnostic tool data link test. **No** REPAIR joint connector No. 1 as necessary. CARRY OUT the diagnostic tool data link test.
Q25 CHECK THE UBP NETWORK WITH THE PARKING AID MODULE DISCONNECTED	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: DATA LINK DIAGNOSTICS Test. • **Did the diagnostic tool indicate system passed?**	**Yes** GO to Q28 . **No** The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.
Q26 CHECK FOR CORRECT DRIVER TEMPERATURE CONTROLLED SEAT MODULE OPERATION	

• Disconnect all the driver temperature controlled seat module connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the driver temperature controlled seat module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new driver temperature controlled seat module. REFER to Section 501-10 . TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Q27 CHECK FOR CORRECT PASSENGER TEMPERATURE CONTROLLED SEAT MODULE OPERATION	
	Yes INSTALL a new passenger

• Disconnect all the passenger temperature controlled seat module connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the passenger temperature controlled seat module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	temperature controlled seat module. REFER to Section 501-10 . TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Q28 CHECK FOR CORRECT PARKING AID MODULE OPERATION	

• Disconnect all the parking aid module connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the parking aid module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new parking aid module. REFER to Section 413-00 . TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test R: The Electronic Parking Brake Module Does Not Respond To The Diagnostic Tool

Refer to Wiring Diagrams Cell 14 for schematic and connector information.

Normal Operation

The electronic parking brake module communicates with the diagnostic tool through the SCP communications network circuits 4-CG16 (GY/RD) and 5-CG16 (BU/RD). If one of the bus wires becomes shorted to ground or voltage, or if some but not all termination resistors are lost, communications can continue. Check circuits 4-CG16 (GY/RD) and 5-CG16 (BU/RD) between the electronic parking brake module C4205b and the data link connector (DLC) C251. Total resistance values must not be more than 5 ohms. If the resistance is more than 5 ohms, there is either an open in circuit 4-CG16 (GY/RD) and 5-CG16 (BU/RD), damage to the DLC C251, damage to the electronic parking brake module C4205b, or a problem in the interior auxiliary junction box (AJB) C283b, C283d, joint connector No. 5 C427 or joint connector No. 4 C223.

Possible Causes

- circuits 4-CG16 (GY/RD) and 5-CG16 (BU/RD) shorted to ground or open
- electronic parking brake module C4205b
- interior AJB C283b, C283d
- joint connector No. 5 C427
- joint connector No. 4 C223
- DLC C251
- electronic parking brake module

PINPOINT TEST R: THE ELECTRONIC PARKING BRAKE MODULE DOES NOT RESPOND TO THE DIAGNOSTIC TOOL

Test Step	Result / Action to Take
R1 CHECK THE ELECTRONIC PARKING BRAKE MODULE C4205b FOR DAMAGE	
• Key in OFF position. • Disconnect: Electronic Parking Brake Module C4205b. • Inspect the electronic parking brake module C4205b for damage. • **Is the electronic parking brake module C4205b OK?**	**Yes** GO to R2 . **No** REPAIR the electronic parking brake module C4205b as necessary. TEST the system for normal operation.
R2 CHECK FOR AN OPEN BETWEEN THE DLC C251 AND THE ELECTRONIC PARKING BRAKE MODULE C4205b	
• Measure the resistance between the electronic parking brake module C4205b-1, circuit 4-CG16 (GY/RD), harness side and the DLC C251-2, circuit 4-EG7 (GY/RD), harness side.  A0057805 • Measure the resistance between the electronic parking brake module C4205b-7, circuit 5-CG16 (BU/RD), harness side and the DLC C251-10, circuit 5-EG7 (BU/RD), harness side.  A0057810 • **Are the resistances less than 5 ohms?**	**Yes** GO to R9 . **No** GO to R3 .
R3 CHECK FOR AN OPEN BETWEEN JOINT CONNECTOR No. 5 C427 AND THE ELECTRONIC PARKING BRAKE MODULE C4205b	
• Disconnect: Joint Connector No. 5 C427. • Measure the resistance between the electronic parking brake module C4205b-1, circuit 4-CG16 (GY/RD), harness side and joint connector No. 5 C427-2, circuit 4-CG16 (GY/RD), harness side.	**Yes** GO to R4 . **No** REPAIR the circuit in question. TEST the system for normal operation.

 A0067866 • Measure the resistance between the electronic parking brake module C4205b-7, circuit 5-CG16 (BU/RD), harness side and joint connector No. 5 C427-13, circuit 5-CG16 (BU/RD), harness side.  A0067867 • **Are the resistances less than 5 ohms?**	
R4 CHECK JOINT CONNECTOR No. 5 FOR AN OPEN	
• Measure the resistance between joint connector No. 5 C427-1, component side and joint connector No. 5 C427-2, component side.  A0067868 • Measure the resistance between joint connector No. 5 C427-12, component side and joint connector No. 5 C427-13, component side.  A0067869 • **Are the resistances less than 5 ohms?**	**Yes** GO to R5 . **No** REPAIR joint connector No. 5 C427 as necessary. TEST the system for normal operation.
R5 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283b AND JOINT CONNECTOR No. 5 C427	
• Disconnect: Interior AJB C283b. • Measure the resistance between the interior AJB C283b-8, circuit 4-EG1 (GY/RD), harness side and joint connector No. 5 C427-1, circuit 4-EG1 (GY/RD), harness side.	**Yes** GO to R6 . **No** REPAIR the circuit in question. CARRY OUT the diagnostic tool data link test.

 A0067870 • Measure the resistance between the interior AJB C283b-4, circuit 5-EG1 (BU/RD), harness side and joint connector No. 5 C427-12, circuit 5-EG1 (BU/RD), harness side.  A0067871 • **Are the resistances less than 5 ohms?**	
R6 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283b AND THE INTERIOR AJB C283d	
• Disconnect: Interior AJB C283d. • Measure the resistance between the interior AJB C283d-16, component side and the interior AJB C283b-8, component side.  A0057792 • Measure the resistance between the interior AJB C283d-12, component side and the interior AJB C283b-4, component side.  A0057793 • **Are the resistances less than 5 ohms?**	**Yes** GO to R7 . **No** INSTALL a new interior AJB. TEST the system for normal operation.
R7 CHECK FOR AN OPEN BETWEEN THE INTERIOR AJB C283d AND JOINT CONNECTOR No. 4 C223	
• Disconnect: Interior Joint Connector No. 4 C223. • Measure the resistance between the interior AJB C283d-16, circuit 4-EG1 (GY/RD), harness side and joint connector No. 4 C223-12, circuit 4-EG1 (GY/RD), harness side.	**Yes** GO to R8 . **No** REPAIR the circuit in question. CARRY OUT the diagnostic tool data link test.

 A0067872 • Measure the resistance between the interior AJB C283d-12, circuit 5-EG1 (BU/RD), harness side and joint connector No. 4 C223-11, circuit 5-EG1 (BU/RD), harness side.  A0067887 • **Are the resistances less than 5 ohms?**	
R8 CHECK JOINT CONNECTOR No. 4 FOR AN OPEN	
• Measure the resistance between joint connector No. 4 C223-12, component side and joint connector No. 4 C223-14, component side.  A0004357 • Measure the resistance between joint connector No. 4 C223-9, component side and joint connector No. 4 C223-11, component side.  A0004362 • **Are the resistances less than 5 ohms?**	**Yes** REPAIR the circuit in question between the DLC C251 and joint connector No. 4 C223. CARRY OUT the diagnostic tool data link test. **No** REPAIR joint connector No. 4 C223. TEST the system for normal operation.
R9 CHECK FOR CORRECT ELECTRONIC PARKING BRAKE MODULE OPERATION	

• Disconnect all the electronic parking brake module connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the electronic parking brake module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new electronic parking brake module. REFER to Section 206-00 . TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No

	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test S: The Parking Aid Module Does Not Respond To The Diagnostic Tool

Refer to Wiring Diagrams Cell 14 for schematic and connector information.

Normal Operation

The parking aid module communicates with the diagnostic tool through the UBP communications network circuit 4-GN10 (GY). If circuit 4-GN10 (GY) becomes open or shorted to ground, communications to that module will not be possible. Check circuit 4-GN10 (GY) between the parking aid module C4014b and the DLC C251. Total resistance values must not be more than 5 ohms. If the resistance is more than 5 ohms, there is either an open in circuit 4-GN10 (GY), damage to the DLC C251, damage to the parking aid module C4014b, or a problem in the in-line connector C213 or joint connector No. 1 C261.

Possible Causes

- circuit 4-GN10 (GY) shorted to ground or open
- C4014b
- in-line C213
- joint connector No. 1 C261
- DLC C251
- parking aid module

PINPOINT TEST S: THE PARKING AID MODULE DOES NOT RESPOND TO THE DIAGNOSTIC TOOL

Test Step	Result / Action to Take
S1 CHECK THE PARKING AID MODULE C4014b FOR DAMAGE	
• Key in OFF position. • Disconnect: Parking Aid Module C4014b. • Inspect the parking aid module C4014b for damage. • **Is the parking aid module C4014b OK?**	**Yes** GO to S2 . **No** REPAIR the parking aid module C4014b. CARRY OUT the diagnostic tool data link test.
S2 CHECK CIRCUIT 4-GN10 (GY) BETWEEN THE DLC C251 AND THE PARKING AID MODULE C4014b FOR AN OPEN	
• Measure the resistance between the parking aid module C4014b-1, circuit 4-GN10 (GY), harness side and the DLC C251-3, circuit 4-ED6 (GY), harness side.	**Yes** GO to S7 . **No** GO to S3 .

 A0057819 • **Is the resistance less than 5 ohms?**	
S3 CHECK IN-LINE C213 FOR DAMAGE	
• Disconnect: In-Line C213. • Inspect in-lines C213M and C213F for damage. • **Are in-lines C213M and C213F OK?**	**Yes** GO to S4 . **No** REPAIR in-lines C213M and C213F. CARRY OUT the diagnostic tool data link test.
S4 CHECK CIRCUIT 4-GN10 (GY) BETWEEN THE PARKING AID MODULE C4014b AND IN-LINE C213F FOR AN OPEN	
• Measure the resistance between in-line C213F-11, circuit 4-HC1 (GY/RD), harness side and the parking aid module C4014b-1, circuit 4-GN10 (GY), harness side.  A0057820 • **Is the resistance less than 5 ohms?**	**Yes** GO to S5 . **No** REPAIR the circuit between the parking aid module C4014b and in-line C213F. CARRY OUT the diagnostic tool data link test.
S5 CHECK CIRCUIT 4-HC1 (GY/RD) BETWEEN IN-LINE C213M AND JOINT CONNECTOR No. 1 C261 FOR AN OPEN	
• Disconnect: Joint Connector No. 1 C261. • Measure the resistance between in-line C213M-11, circuit 4-HC1 (GY/RD), harness side and joint connector No. 1 C261-11, circuit 4-HC1 (GY/RD), harness side.  A0067849 • **Is the resistance less than 5 ohms?**	**Yes** GO to S6 . **No** REPAIR the circuit between in-line C213M and joint connector No. 1 C261. CARRY OUT the diagnostic tool data link test.
S6 CHECK JOINT CONNECTOR No. 1 FOR AN OPEN	

• Measure the resistance between joint connector No. 1 C261-10, component side and joint connector No. 1 C261-11, component side.  • **Is the resistance less than 5 ohms?**	**Yes** REPAIR the circuit between joint connector No. 1 C261 and the DLC C251. CARRY OUT the diagnostic tool data link test. **No** REPAIR joint connector No. 1 C261 as necessary. CARRY OUT the diagnostic tool data link test.
S7 CHECK FOR CORRECT PARKING AID MODULE OPERATION	

• Disconnect all the parking aid module connectors.
• Check for:
  • corrosion
  • push-out pins
• Connect all the parking aid module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new parking aid module. REFER to Section 413-00 . TEST the system for normal operation.
	
	CARRY OUT the diagnostic tool data link test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test T: No Module/Network Communication No Power To The Diagnostic Tool

Refer to Wiring Diagrams Cell 14 for schematic and connector information.

Normal Operation

Under normal operation the diagnostic tool is connected to the DLC C251 to communicate with the standard corporate protocol (SCP), UART based protocol (UBP), and the international standards organization (ISO) 9141 communications networks. If communication cannot be established, the diagnostic tool and the DLC C251 must be checked for damage. If the diagnostic tool and the DLC C251 are OK, circuit 29-ED6 (OG/YE) must be checked for voltage and 31-ED6 (BK), and 91-ED6 (BN) must be checked for an open condition.

Possible Causes

- DLC C251
- diagnostic tool
- circuit 29-ED6 (OG/YE) open circuit
- circuit 31-ED6 (BK) open circuit
- circuit 91-ED6 (BN) open circuit

PINPOINT TEST T: NO MODULE/NETWORK COMMUNICATION NO POWER TO THE DIAGNOSTIC TOOL

Test Step	Result / Action to Take
T1 CHECK THE DIAGNOSTIC TOOL CONNECTOR	

• Inspect the diagnostic tool pins for damage. • **Are the pins OK?**	**Yes** GO to T2 . **No** REPAIR the diagnostic tool connector. TEST the system for normal operation.
T2 CHECK THE DLC C251 FOR DAMAGE	
• Key in OFF position. • Inspect the DLC C251 pins for damage. • **Are the pins OK?**	**Yes** GO to T3 . **No** REPAIR the DLC C251. TEST the system for normal operation.
T3 CHECK THE VOLTAGE TO THE DIAGNOSTIC TOOL CIRCUIT 29-ED6 (OG/YE)	
• Measure the voltage between the DLC C251-16, circuit 29-ED6 (OG/YE), harness side and ground.  A0057821 • **Is the voltage greater than 10 volts?**	**Yes** GO to T4 . **No** REPAIR the supply circuit. TEST the system for normal operation.
T4 CHECK THE DLC GROUND CIRCUIT 31-ED6 (BK), AND CIRCUIT 91-ED6 (BN)	
• Measure the resistance between the DLC C251-4, circuit 31-ED6 (BK), harness side and ground and between the DLC C251-5, circuit 91-ED6 (BN), harness side and ground.  A0057822 • **Are the resistances less than 5 ohms?**	**Yes** REPAIR the diagnostic tool. TEST the system for normal operation. **No** REPAIR the circuit(s) in question. TEST the system for normal operation.

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, connect the diagnostic tool to the data link connector and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:

- check that the program card is correctly installed.
- check the connections to the vehicle.
- check the ignition switch position.

5. If diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

6. Carry out the data link diagnostics test. If the diagnostic tool responds with:

- SCP+, SCP-, or UBP circuits fault; all electronic control units no response/not equipped, Go To Pinpoint Test O .
- No response/not equipped for FEM, Go To Pinpoint Test U .
- System passed, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out self-test diagnostics for the DSM.

7. If the DTCs retrieved are related to the concern, go to the Diagnostic Trouble Code (DTC) Index to continue diagnostics.

8. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

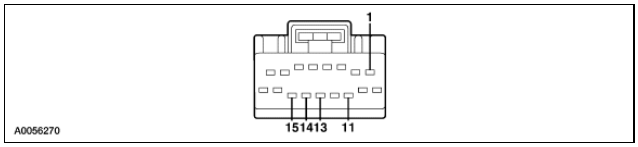
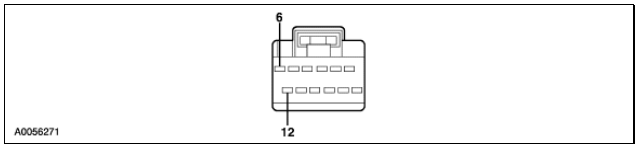
Front Electronic Module (FEM) C201a



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	29S-DK22 (OG/WH) FEM power supply.	10 volts or greater at the FEM connector.
11	31-DK20A (BK/RD) FEM ground.	Less than 5 ohms between the FEM connector and ground.
13	31-DK20B (BK/RD) FEM ground.	Less than 5 ohms between the FEM connector and ground.
14	31-DK20C (BK/RD) FEM ground.	Less than 5 ohms between the FEM connector and ground.
15	31-DK20D (BK/RD) FEM ground.	Less than 5 ohms between the FEM connector and ground.

Front Electronic Module (FEM) C201c



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
6		10 volts or greater at the FEM connector.

	29-DK20 (OG/GN) FEM power supply.	
12	31-DK20 (BK) FEM ground.	Less than 5 ohms between the FEM connector and ground.

Pinpoint Test U: No Communication With The Front Electronic Module (FEM)

Refer to Wiring Diagrams Cell 14 for schematic and connector information.

Normal Operation

The FEM controls RH exterior mirrors, power adjustable pedals, both interior and exterior lighting active anti-theft functions and the brake shift interlock. Power is supplied through the central junction box (CJB) fuse 20 (10A) and battery junction box (BJB) fuse 30 (5A) on Circuits 29-DK20 (OG/GN), 29-DK21 (OG/WH) and grounded through circuit 31-DK20 (BK/RD), 31-DK20A (BK/RD), 31-DK20B (BK/RD), 31-DK20C (BK/RD) and 31-DK20D (BK/RD).

Possible Causes

- CJB fuse 20 (10A)
- BJB fuse 30 (5A)
- circuit 29-DK20 (OG/GN) open or shorted to ground
- circuit 29S-DK22 (OG/WH) open or shorted to ground
- circuit 31-DK20 (BK/RD) open
- circuit 31-DK20A (BK/RD) open
- circuit 31-DK20B (BK/RD) open
- circuit 31-DK20C (BK/RD) open

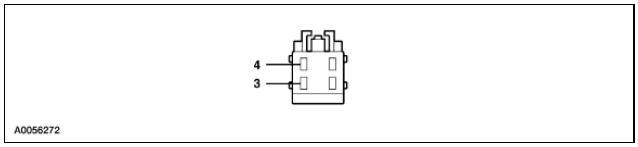
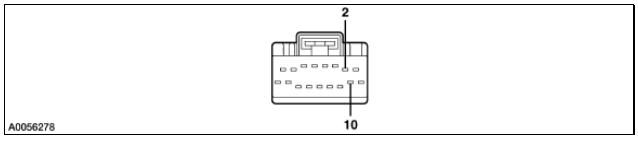
Driver Seat Module (DSM) C341b



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
3	31-AH80 (BK) DSM ground	Less than 5 ohms between the DSM connector and ground.
4	30-AH80 (RD) DSM power supply	10 volts or greater at the DSM connector.

Driver Seat Module (DSM) C341c



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
2	91-AH80 (BK) DSM ground.	Less than 5 ohms between the DSM connector and ground.
10	29-AH80 (OG/WH) DSM power supply.	10 volts or greater at the DSM connector.

Pinpoint Test V: No Communication With The Driver Seat Module (DSM)

Refer to Wiring Diagrams Cell 14-1 for schematic and connector information.

Normal Operation

The power driver seat and power outside rear view mirrors are controlled by the DSM. Power is supplied through central junction box (CJB) fuse 7 (5A) and battery junction box (BJB) fuse 21 (20A) on Circuits 29-AH80 (OG/WH) and 30-AH80 (RD). The DSM is grounded through circuits 31-AH80 (BK) and 91-AH80 (BK).

Possible Causes

- CJB fuse: 7 (5A)
- BJB fuse 21 (20A)
- circuit 29-AH80 (OG/WH) open or shorted to ground
- circuit 30-AH80 (RD) open or shorted to ground
- circuit 31-AH80 (BK) open
- circuit 91-AH80 (BK) open

Front Electronic Module (FEM) Printable View (237 KB)

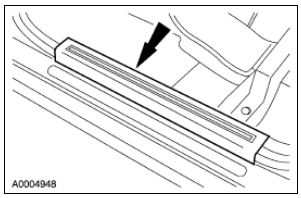
Removal and Installation

1. **⚠ CAUTION: Prior to the removal of the module, it is necessary to upload module configuration information to the appropriate diagnostic equipment. This information needs to be downloaded into the new module once installed. For additional information, refer to Module Configuration in this section.**

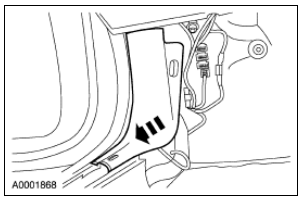
   ⚠ CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

   Disconnect the battery ground cable. For additional information, refer to Section 414-00 .

2. Remove the LH scuff plate.

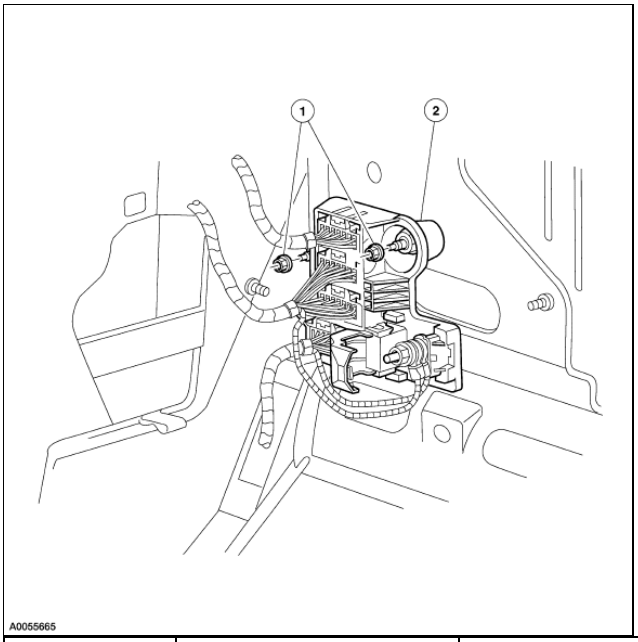


3. Remove the LH A-pillar lower trim panel.



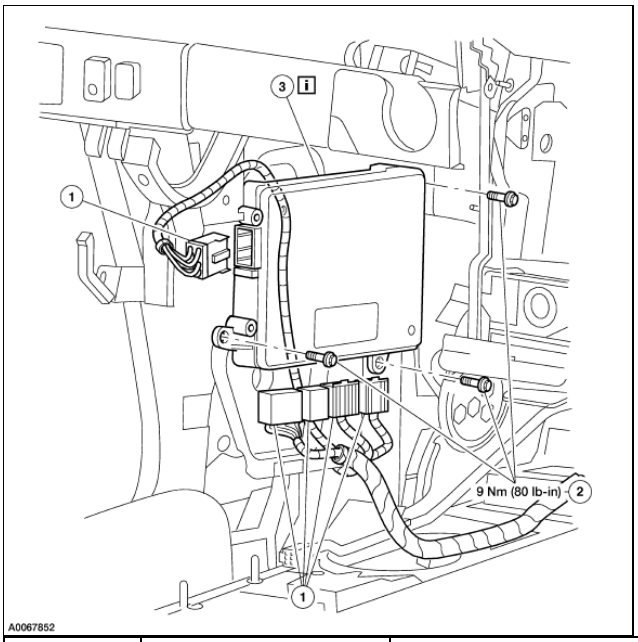
4. Position the carpet aside.

5. Position aside the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1		Nuts
2	14A033	Auxiliary junction box

6. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1		Wiring harness connectors
2		Bolts
3	13B525	Front electronic module (FEM) Installation Note

7. To install, reverse the removal procedure.

Item 3: Front Electronic Module (FEM) Installation Note

1. Once the FEM is installed, it is necessary to download the module configuration information from the daignostic tool into the new module. Refer to Module Configuration in this section.

Driver Seat Module (DSM) Printable View (93 KB)

Removal and Installation

1. **⚠ CAUTION: Prior to the removal of the module, it is necessary to upload module configuration information to the appropriate diagnostic equipment.    ⚠ CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

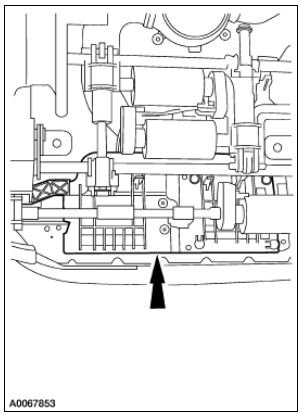
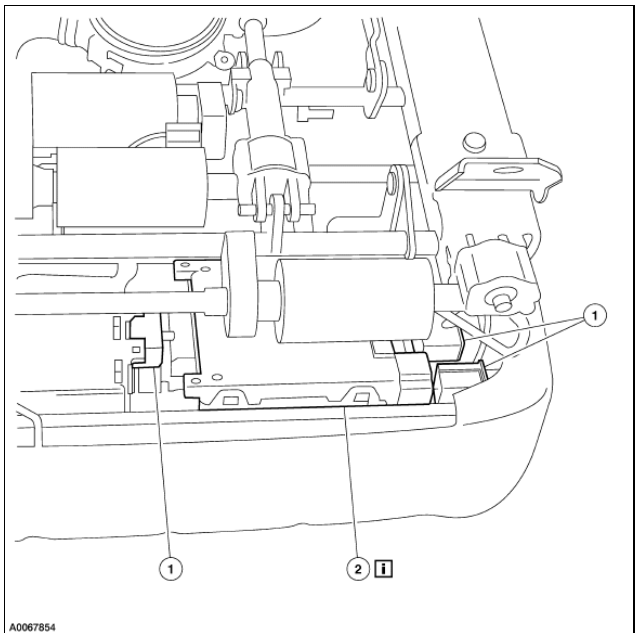
   Disconnect the battery ground cable. For additional information, refer to Section 414-00 .

2. Remove the driver seat. For additional information, refer to Section 501-10 .

3. Remove the shield.



4. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description

1		Wiring harness connectors
2	13C789	Driver seat module (DSM) Installation Note

5. To install, reverse the removal procedure.

Item 2: Driver Seat Module (DSM) Installation Note

1. Once the DSM is installed, it is necessary to download the module configuration information from the daignostic tool into the new module. Refer to Module Configuration in this section.

Driver Door Module (DDM) Printable View (97 KB)

Removal and Installation

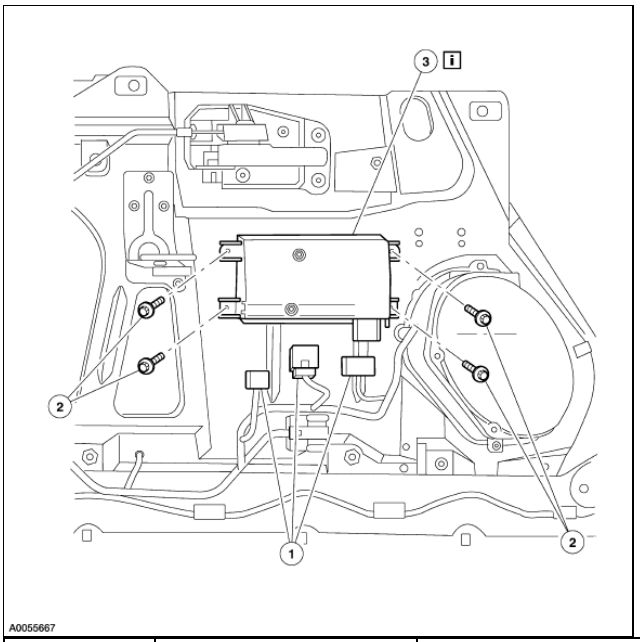
1. **CAUTION: Prior to the removal of the module, it is necessary to upload module configuration information to the appropriate diagnostic equipment. This information needs to be downloaded into the new module once installed. For additional information, refer to Module Configuration in this section.**

   CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

   Disconnect the battery ground cable. For additional information, refer to Section 414-00 .

2. Remove the driver door trim panel. For additional information, refer to Section 501-01 .

3. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1		Wiring harness connectors
2		Bolts
3	13C791	Driver door module (DDM) Installation Note

4. To install, reverse the removal procedure.

Item 3: Driver Door Module (DDM) Installation Note

1. Once the DDM is installed, it is necessary to download the module configuration information from the daignostic tool into the new module. Refer to Module Configuration in this section.

Rear Electronic Module (REM) Printable View (120 KB)

Removal and Installation

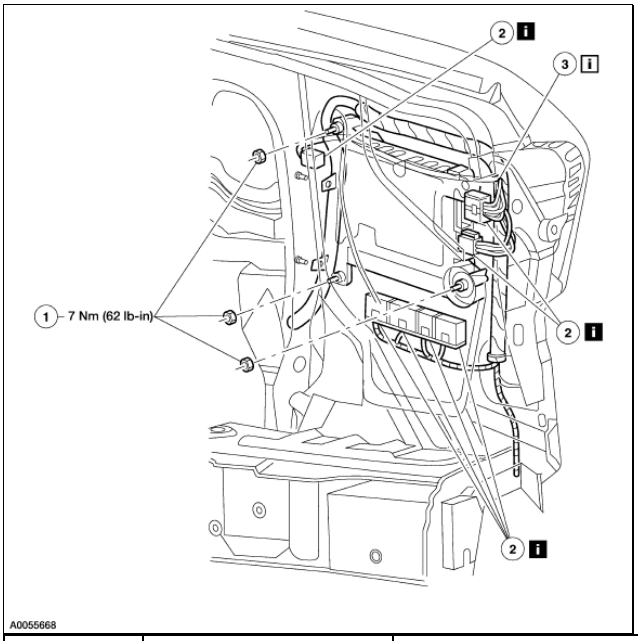
1. **⚠ CAUTION: Prior to the removal of the module, it is necessary to upload module configuration information to the appropriate diagnostic equipment. This information needs to be downloaded into the new module once installed. For additional information, refer to Module Configuration in this section.**

   ⚠ CAUTION: Electronic modules are sensitive to static electrical charges. If exposed to these charges, damage may result.

   Disconnect the battery ground cable. For additional information, refer to Section 414-00 .

2. Position the RH rear luggage compartment trim panel aside.

3. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1		Nuts Removal Note
2		Wiring harness connectors Removal Note
3	13B520	Rear electronic module (REM) Installation Note

4. To install, reverse the removal procedure.

Item 2: Rear Electronic Module (REM) Wiring Harness Connector Removal Note

1. It may be necessary to position the REM rearward to access some of the connectors.

Item 3: Rear Electronic Module (REM) Installation Note

1. Once the REM is installed, it is necessary to download the module confiuration information from the daignostic tool into the new module. Refer to Module Configuration in this section.

Anti-Theft Printable View (12 KB)

Anti-Theft Passive Anti-Theft System (PATS)

The passive anti-theft system (PATS) uses radio frequency identification technology to deter a driveaway theft. Passive means that it does not require any action from the user to make it functional.

PATS uses a specially encoded ignition key. Each PATS key contains a permanently installed electronic device called a transponder. Each transponder contains a unique electronic identification code, with over 72 million billion combinations.

Each PATS key must be programmed into the vehicle PATS module before it can be used to start the engine. There are special diagnostic procedures described in the workshop manual that must be carried out if new PATS keys are to be installed. Refer to general procedures in this section.

The PATS key is larger than a traditional ignition key. The PATS key does not require batteries and should last the life of the vehicle.

The transceiver module communicates with the PATS key. This module is located in the instrument panel attached to the ignition cylinder housing. During each vehicle start sequence, the transceiver module reads the PATS key identification code and sends the data to the instrument cluster. The instrument cluster validates the code as correct and sends the PCM an enable code through the network.

The control function is contained in the instrument cluster. This module carries out all of the PATS functions such as receiving the identification code from the PATS key and controlling the starter enable signal and communicates with the PCM to enable the engine. The instrument cluster initiates the key interrogation sequence when the PATS key is inserted in the ignition switch and also when the switch is turned to RUN or START.

The PATS module uses the instrument cluster to enable or disable the engine. All elements of PATS must be functional before the engine is allowed to start. If any of the components are not working correctly, the vehicle will not start.

PATS uses a visual theft indicator. This indicator will prove out for three seconds when the ignition switch is turned to RUN or START under normal operation. If there is a PATS problem, this indicator will either flash rapidly or glow steadily (for more than three seconds) when the ignition switch is turned to RUN or START.

PATS is not compatible with aftermarket remote start systems, which allow the vehicle to be started from outside the vehicle. These systems may reduce the vehicle security level, and also may cause no-start issues. Remote start systems must be removed before investigation of PATS-related no-start issues.

Anti-Theft Perimeter Alarm System

The anti-theft perimeter protection feature is controlled by the front electronic module (FEM), the rear electronic module (REM), and the driver door module (DDM). The alarm can be armed using the LOCK button in the remote transmitter to the DDM, which sends a message through the Standard Corporate Protocol (SCP) communications network to the FEM; or by using the driver or passenger door lock switch if the corresponding door is open when LOCK is actuated; or by locking the vehicle with the key in the driver door lock cylinder or the keypad by pressing 7/8 and 9/0 simultaneously. The FEM and REM will then monitor all features, which will activate the alarm in the event of an unauthorized entry.

The luggage compartment lid key cylinder will not disarm the vehicle's perimeter alarm. The luggage compartment alarm can be temporarily inhibited through the luggage compartment lid disarm switch, located in the luggage compartment lock key cylinder or opening the lugguage compartment with the remote entry key fob or the keypad. Once the luggage compartment lid closes, the perimeter alarm system will immediately start monitoring the luggage compartment. The perimeter alarm can only be disarmed by unlocking the vehicle using the remote transmitter or the driver door lock cylinder switch, or by cycling to RUN a valid programmed key in the ignition switch or by entering the correct vehicle unlock code on the keypad.

Additionally, an ignition switch tamper circuit and a signal headwire line from the FEM to the REM are monitored.

If any of the above features receive any activation once the alarm has been armed, the alarm will activate the visual and audible alerts.

Anti-Theft PATS Printable View (166 KB)

Refer to Wiring Diagrams Cell 112 , Anti-Theft for schematic and connector information.

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052 or equivalent diagnostic tool with appropriate adapter cable

Inspection and Verification

NOTE: The new instrument cluster must be reconfigured after installation. Refer to Section 418-00 .

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical and electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Large metallic objects, a second PATS key on the same key ring as the PATS key or electronic devices on the key chain that can be used to purchase gasoline or similar items • ignition lock cylinder • PATS key • Use of a non-PATS key • More than one PATS key on the customer's key chain	• Central junction box (CJB) fuse 24 (5A) • Instrument cluster • PATS transceiver module • Ignition switch • Loose or corroded connection(s)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, connect the diagnostic tool to the data link connector and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
    - check that the program card is correctly installed.
    - check the connections to the vehicle.
    - check the ignition key position.

5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

6. Carry out the diagnostic tool data link test. If the diagnostic tool responds with:
    - SCP+, SCP-, ISO or UBP circuit fault; all electronic control units no response/not equipped, refer to Section 418-00 .
    - No response/not equipped for instrument cluster, refer to Section 413-00 .
    - No response/not equipped for PCM, refer to Powertrain Control/Emissions Diagnosis (PC/ED) manual.
    - System passed, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out self-test diagnostics for the instrument cluster.

7. If the DTCs retrieved are related to the concern, go to the Instrument Cluster Diagnostic Trouble Code (DTC) Index.

8. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Instrument Cluster Diagnostic Trouble Code (DTC) Index

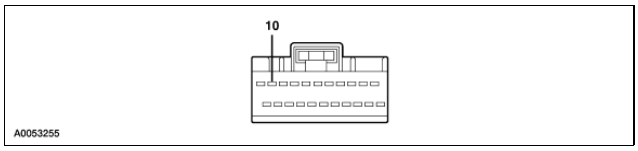
DTC	Description	Source	Action
B1213	Anti-Theft Number of Programmed Keys is Below Minimum	Instrument Cluster	Go To Pinpoint Test C .
B1342	ECU is Defective	Instrument Cluster	Clear the DTCs. CARRY OUT the Instrument Cluster self-test. If DTC B1342 is retrieved, INSTALL a new instrument cluster. REFER to Section 413-00 .
B1600	PATS Key Transponder Signal is Not Received Damaged Key or Non-PATS Key	Instrument Cluster	Go To Pinpoint Test F .
B1601	PATS Received Incorrect Key-Code From Ignition Key Transponder (Unprogrammed PATS Key)	Instrument Cluster	Go To Pinpoint Test G .
B1602	PATS Received Invalid Format of Key-Code From Ignition Key Transponder (Partial Key Read)	Instrument Cluster	Go To Pinpoint Test H .
B1681	PATS Transceiver Module Signal is Not Received (Damaged, Not Connected, or Damaged Wiring)	Instrument Cluster	Go To Pinpoint Test I .
B2103	Antenna Not Connected Defective Transceiver	Instrument Cluster	Go To Pinpoint Test J .
B2139	Data Mismatch	Instrument Cluster	Go To Pinpoint Test D .
B2141	NVM Memory Failure	Instrument Cluster	Go To Pinpoint Test E .

B2431	Transponder Programming Failed	Instrument Cluster	Go To Pinpoint Test F .
B2477	Module Configuration Failure	Instrument Cluster	REFER to Section 418-00 .
U1147	SCP (J1850) Invalid or Missing Data for Vehicle Security	Instrument Cluster/PCM	Go To Pinpoint Test D .
U1262	SCP Communications BUS Fault	Instrument Cluster/PCM	REFER to Section 418-00 .

Symptom Chart

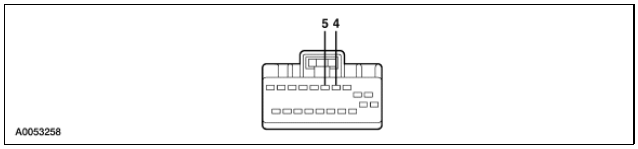
Symptom Chart
Connector Circuit Reference

Instrument Cluster C220a



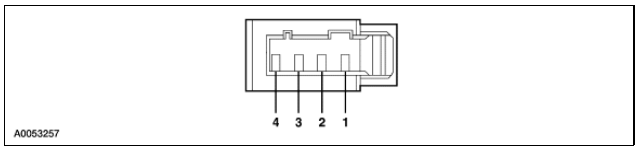
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
10	10-GL6 (GY/VT) transmits signal to anti-theft LED	0 voltage, 5 ohms or less between the instrument cluster and the anti-theft LED. Greater than 10,000 ohms to ground with the instrument cluster and the anti-theft LED disconnected.

Instrument Cluster C220b



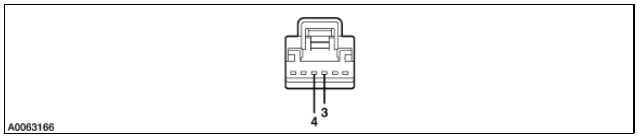
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
4	8-GL36 (WH/RD) transmits signal to PATS	0 voltage, 5 ohms or less between the instrument cluster and the PATS transceiver. Greater than 10,000 ohms to ground with the instrument cluster and the PATS transceiver disconnected.
5	10-GL36 (GY/RD) recieves signal from PATS	0 voltage, 5 ohms or less between the instrument cluster and the PATS transceiver. Greater than 10,000 ohms to ground with the instrument cluster and the PATS transceiver disconnected.

Passive Anti Theft (PATS) C252



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	29S-GL36 (OG/BU) power feed to the PATS transceiver	Greater than 10 volts key ON or OFF.
2	31-GL36 (BK) ground for the PATS transceiver	0 voltage, less than 5 ohms.
3	8-GL36 (WH/RD) transmits signal to instrument cluster	0 voltage, 5 ohms or less between the instrument cluster and the PATS transceiver. Greater than 10,000 ohms to ground with the instrument cluster and the PATS transceiver disconnected.
4	10-GL36 (GY/RD) receives signal from instrument cluster	0 voltage, 5 ohms or less between the instrument cluster and the PATS transceiver. Greater than 10,000 ohms to ground with the instrument cluster and the PATS transceiver disconnected.

Autolamp Sensor C286



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
3	29-GL6 (OG) autolamp sensor power	12 volts, 5 ohms or less between the autolamp sensor and the central juncyion box. Greater than 10,000 ohms to ground with the instrument cluster and the autolamp sensor disconnected.
4	10-GL6 (GY/VT) receives signal from instrument cluster	0 voltage, 5 ohms or less between the autolamp sensor and the instrument cluster. Greater than 10,000 ohms to ground with the instrument cluster and the autolamp sensor disconnected.

Pinpoint Test A: The Anti-Theft Indicator Is Never On No Three-Second Theft Indicator Proveout

Normal Operation

The PATS uses an LED indicator. This indicator will prove out for three seconds when the key switch is turned to RUN or START under normal operation. If there is a PATS problem, this indicator will either flash rapidly or glow steadily (for more than three seconds) when the key switch is turned to RUN or START.

Possible Causes

- no signal from the instrument cluster
- anti-theft LED is inoperative
- instrument cluster
- circuit 31-LE42 (BK) open or short to power
- circuit 10-GL6 (GY/VT) open or short to ground
- circuit 29-GL6 (OG) open or short to ground

PINPOINT TEST A: THE ANTI-THEFT INDICATOR IS NEVER ON NO THREE SECOND THEFT INDICATOR PROVE-OUT

Test Step	Result / Action to Take
NOTE: Large metallic objects, electronic devices on the keychain that can be used to purchase gasoline or similar items, or a second key on the same keyring as the PATS key may cause vehicle starting problems and record DTCs under certain conditions. If a fault cannot be identified, examine the customer's key ring for such objects or devices. If present, inform the customer that they need to keep these objects from touching the PATS key while starting the engine. These objects and devices cannot damage the PATS key, but can cause a momentary concern if they are too close to the key during engine start. If a concern occurs, turn the key OFF and restart the engine with all other objects on the keyring held away from the PATS key. Check to make sure the key used by the customer is a Ford-approved PATS key. (PATS keys from Rotunda, Ilco, Curtis, or Strattec are approved Ford PATS keys.)	
A1 ENTER THE INSTRUMENT CLUSTER ACTIVE COMMAND MODE	
• Key in OFF position. • Enter the instrument cluster active command mode. • **Can the instrument cluster active command mode be entered?**	**Yes** GO to A2 . **No** REFER to Section 418-00 to continue communication diagnostics.
A2 CHECK THE ANTI-THEFT INDICATOR TRIGGER THE INSTUMENT CLUSTER ACTIVE COMMAND THEFT_LAMP TO ON	
• Trigger the instrument cluster active command THEFT_LAMP to ON. • **Does the anti-theft indicator illuminate?**	**Yes** The anti-theft indicator is OK. VERIFY the concern with the customer. **No** GO to A3 .
A3 CHECK THE INSTRUMENT CLUSTER OUTPUT TO THE AUTOLAMP DAY/NIGHT SENSOR FOR VOLTAGE CIRCUIT 10-GL6 (GY/VT)	
• Key in OFF position. • Disconnect: Autolamp Day/Night Sensor C286. • Key in ON position.	**Yes** GO to A5 . **No** GO to A4 .

• While triggering the instrument cluster active command THEFT_LAMP to ON, measure the voltage between autolamp day/night sensor C286-4, circuit 10-GL6 (GY/VT), harness side and ground.  A0063167 • **Is the voltage greater than 10 volts?**	
A4 CHECK CIRCUIT 10-GL6 (GY/VT) FOR OPEN	
• Key in OFF position. • Disconnect: Instrument Cluster C220a. • Measure the resistance between instrument cluster C220a-10, circuit 10-GL6 (GY/VT), harness side and autolamp day/night sensor C286-4, circuit 10-GL6 (GY/VT), harness side.  A0063168 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new instrument cluster. REFER to Section 413-00 . CLEAR the DTCs. TEST the system for normal operation. PROGRAM the keys. REFER to Key Programming Using Diagnostic Equipment in this section. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A5 CHECK THE ANTI-THEFT LED	
• Disconnect: Anti-Theft LED. • Measure the resistance between C286-4 and C286-3 component side.  A0062313 • **Is the resistance greater than 10,000 ohms in one direction and 10-20 ohms in the other direction?**	**Yes** GO to A6 . **No** INSTALL a new anti-theft LED. REFER to Section 413-00 . CLEAR the DTCs. REPEAT the self-test.
A6 CHECK THE AUTOLAMP DAY/NIGHT SENSOR FOR VOLTAGE CIRCUIT 29-GL6 (OG)	

• Key in OFF position. • Measure the voltage between autolamp day/night sensor C286-3, circuit 29-GL6 (OG), and ground.  A0063169 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new autolamp day/night sensor. REFER to Section 417-01 . CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test B: The Anti-Theft System Does Not Operate Correctly The Vehicle Cranks But Indicator Flashes Rapidly At Key On

Normal Operation

The PATS uses an LED indicator. This indicator will prove out for three seconds when the key switch is turned to RUN or START under normal operation. If there is a PATS problem, this indicator will either flash rapidly or glow steadily (for more than three seconds) when the key switch is turned to RUN or START.

Possible Causes

- instrument cluster
- instrument cluster calibration

PINPOINT TEST B: THE ANTI-THEFT SYSTEM DOES NOT OPERATE CORRECTLY THE VEHICLE CRANKS BUT INDICATOR FLASHES RAPIDLY AT KEY ON

Test Step	Result / Action to Take
B1 CHECK THE ANTI-THEFT INDICATOR FOR CORRECT OPERATION	
• Key in START position. • Verify the anti-theft indicator proves out correctly. • **Does the vehicle start with the anti-theft indicator flashing?**	**Yes** If the vehicle starts, VERIFY the correct PCM calibration for the vehicle. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** The system is OK.

Pinpoint Test C: The Anti-Theft System Does Not Operate Correctly Anti-Theft Number Of Programmed Keys Is Below Minimum

Normal Operation

The transceiver module communicates with the PATS key. The control functions are contained in the instrument cluster. This instrument cluster carries out all of the PATS functions such as receiving the identification code from the PATS key and controlling engine enable. The instrument cluster initiates the key interrogation sequence when the key is inserted in the ignition cylinder and when the key is turned to START or RUN.

Possible Causes

- less than two keys programmed to the system
- PATS transceiver
- unprogrammed PATS key
- instrument cluster

PINPOINT TEST C: THE ANTI-THEFT SYSTEM DOES NOT OPERATE CORRECTLY ANTI-THEFT NUMBER OF PROGRAMMED KEYS IS BELOW MINIMUM

Test Step	Result / Action to Take
C1 RETRIEVE THE INSTRUMENT CLUSTER DTCS	
• Key in OFF position. • Enter the following diagnostic mode on the diagnostic tool: Retrieve and Record Continuous Instrument Cluster Codes. • Enter the following diagnostic mode on the diagnostic tool: Clear Continuous Codes. • Carry out the instrument cluster on-demand self-test. • **Is DTC B1213 the only DTC retrieved?**	**Yes** GO to C2 . **No** REPAIR the other DTCs retrieved. REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Index. CLEAR the DTCs. REPEAT the self-test.
C2 CHECK FOR PROGRAMMED PATS KEYS MONITOR THE INSTRUMENT CLUSTER PID NUMKEYS	
• Monitor the instrument cluster PID NUMKEYS. • **Does the instrument cluster PID NUMKEYS display less than two PATS keys programmed?**	**Yes** GO to C3 . **No** The system is OK.
C3 PROGRAM PATS KEYS	
• **NOTE:** Two PATS keys must be programmed in order to start the vehicle. • Cut a new PATS key. • Key in ON position. • Program the new PATS key(s). Refer to Key Programming Using	**Yes** CLEAR the DTCs. CARRY OUT the self-test to verify all codes have been cleared. REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Index. If the vehicle is equipped with the valet feature, program the third key (if available) or instruct the customer on how to carry out this service. REFER to Key Programming Using Two Programmed Keys in this section. **No**

Diagnostic Equipment in this section. • **Does the anti-theft indicator illuminate for three seconds and then go out?**	If the anti-theft indicator is on continuously, REPEAT Step C3 with a second new PATS key. If the theft indicator is flashing, RETRIEVE DTC stored for new fault and REPAIR the other DTC(s) retrieved. REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Index.

Pinpoint Test D: Data Mismatch (Received Data Does Not Match What Was Expected)

Normal Operation

The transceiver module communicates with the PATS key. The control functions are contained in the instrument cluster. This instrument cluster carries out all of the PATS functions such as receiving the identification code from the PATS key and controlling engine enable. The instrument cluster initiates the key interrogation sequence when the key is inserted in the ignition cylinder and when the key is turned to RUN or START.

Possible Causes

- PCM calibration
- instrument cluster calibration
- instrument cluster

PINPOINT TEST D: DATA MISMATCH (RECEIVED DATA DOES NOT MATCH WHAT WAS EXPECTED)

Test Step	Result / Action to Take
D1 USE THE DTCS FROM THE INSTRUMENT CLUSTER SELF-TEST	
• Use the recorded instrument cluster DTCs. • **Is DTC B2139 or U1147 recorded?**	**Yes** GO to D2 . **No** The system is OK.
D2 CLEAR PCM ID FROM INSTRUMENT CLUSTER AND PCM	
• Carry out the security access procedure for the instrument cluster. Refer to Anti-Theft Security Access in this section. • **NOTE:** DO NOT carry out ignition key code erase.	**Yes** VERIFY PCM calibration is correct for the vehicle. If correct, INSTALL a new instrument cluster. REFER to Section 413-00 . TEST the system for normal operation. Program two keys. REFER to Key Programming Using Diagnostic Equipment in this section. REPEAT Pinpoint Test D . CLEAR the DTCs. REPEAT the self-test. If DTC B2139 or U1147 still exists, INSTALL a new PCM. REFER to Section 303-04A or Section 303-04B . TEST the system for normal operation. If the vehicle is equipped with the valet feature, program the third PATS key (if available) or instruct the customer on how to carry out this service. REFER to Key Programming Using Two Programmed Keys in this section. **No**

• Select PARAMETER RESET command for instrument cluster. • Use the diagnostic tool for PCM active command KEEP ALIVE MEMORY RESET. • Key in OFF position. • Key in ON position for three seconds. • Enter the following diagnostic mode on the diagnostic tool: Clear Continuous Codes. • Key in OFF position. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Retrieve Continuous Codes. • **Is DTC B2139 or U1147 retrieved?**	The system is OK. CHECK for any other DTCs. REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Index.

Pinpoint Test E: The Anti-Theft System Does Not Operate Correctly NVM Configuration Failure (No PCM ID Exchanged Between Instrument Cluster And PCM)

Normal Operation

The PCM and instrument cluster verify correct PATS operation through the SCP network when the key is turned to the RUN position.

Possible Causes

- instrument cluster

PINPOINT TEST E: THE ANTI-THEFT SYSTEM DOES NOT OPERATE CORRECTLY NVM CONFIGURATION FAILURE (NO PCM ID EXCHANGED BETWEEN INSTRUMENT CLUSTER AND PCM)

Test Step	Result / Action to Take

E1 USE THE DTCS FROM THE INSTRUMENT CLUSTER SELF-TEST	
• Use the recorded instrument cluster continuous and on demand self-test DTCs. • **Is DTC B2141 retrieved?**	**Yes** GO to E2 . **No** The system is OK.
E2 CARRY OUT KEEP ALIVE MEMORY RESET FROM PCM	
• Use the diagnostic tool for PCM active command KEEP ALIVE MEMORY RESET. • **Did the keep alive memory reset occur?**	**Yes** GO to E3 . **No** REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual.
E3 TRANSFER PCM ID	
• Key in OFF position. • Key in ON position. Leave the key in the ON position for 30 seconds. • Key in OFF position. • Key in START position. • **Does the vehicle START?**	**Yes** The system is OK. **No** GO to E4 .
E4 RETRIEVE THE INSTRUMENT CLUSTER DTCS	
• Enter the following diagnostic mode on the diagnostic tool: Clear Instrument Cluster Continuous Codes. • Key in OFF position. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Retrieve Instrument Cluster Continuous Codes. • **Is DTC B2141 retrieved?**	**Yes** REPEAT Step E2. If the fault persists, VERIFY the PCM calibration. If the calibration is OK, INSTALL a new instrument cluster. REFER to Section 413-00 . PROGRAM the keys. REFER to Key Programming Using Diagnostic Equipment in this section. Go To Pinpoint Test D to initialize the module. CLEAR the DTCs. REPEAT the self-test. If the vehicle is equipped with the valet feature, program the third key (if available) or instruct the customer on how to carry out this service. REFER to Key Programming Using Two Programmed Keys in this section. **No** REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Index.

Pinpoint Test F: The Anti-Theft System Does Not Operate Correctly PATS Ignition Key Transponder Signal Is Not Received Or Transponder Programming Failed (Damaged Key Or Non-PATS Key)

Normal Operation

The transceiver module communicates with the PATS key. The control functions are contained in the instrument cluster. This instrument cluster carries out all of the PATS functions such as receiving the identification code from the PATS key and controlling starter enable. The instrument cluster initiates the key interrogation sequence when the key is inserted in the ignition when the key is turned to RUN or START.

Possible Causes

- instrument cluster
- PATS transceiver
- PATS key

PINPOINT TEST F: THE ANTI-THEFT SYSTEM DOES NOT OPERATE CORRECTLY PATS IGNITION KEY TRANSPONDER SIGNAL IS NOT RECEIVED OR TRANSPONDER PROGRAMMING FAILED (DAMAGED KEY OR NON-PATS KEY)

Test Step	Result / Action to Take
NOTE: Large metallic objects, electronic debit transponder devices or a second key on the same key ring as the PATS key may cause vehicle starting problems and record DTCs under certain conditions. If a fault cannot be identified, examine the customer's key for such objects or devices. If present, inform the customer that they need to keep these objects from touching the PATS key while starting the engine. These objects and devices cannot damage the PATS key, but can cause a momentary problem if they are too close to the key during engine start. If a problem occurs, turn the key OFF and restart the engine with all other objects on the key ring held away from the PATS key. Check to ensure the PATS key used by the customer is an approved Ford PATS key (PATS keys from Rotunda, Ilco, Curtis, C.E. Marshall or Strattec are approved Ford PATS keys).	
F1 USE THE DTCS FROM THE INSTRUMENT CLUSTER SELF-TEST	
• Use the recorded instrument cluster continuous and on-demand self-test DTCs. • **Is DTC B1600 or B2431 retrieved?**	**Yes** GO to F2 . **No** If other DTCs are retrieved, REFER to Instrument Cluster Diagnostic Trouble Code (DTC) Index. If no DTCs are retrieved, system is OK.
F2 PROGRAM A NEW PATS KEY	
• Key in OFF position. • **NOTE:** Check to make sure the customer and replacement PATS keys are approved Ford encoded PATS keys. Unapproved PATS keys do not always operate correctly over different temperature ranges (PATS keys from Rotunda, Ilco, Curtis, C.E. Marshall or Strattec are approved PATS keys). • Cut a new PATS key. • Key in ON position. • Program the new PATS key. Refer to Key Programming Using Diagnostic Equipment in this section. • Enter the following diagnostic mode on the diagnostic tool: Clear Continuous	**Yes** GO to F3 . **No** If no other DTCs are retrieved, the system is OK. If other DTCs are retrieved, REFER to Instrument Cluster Diagnostic Trouble Code (DTC) Index.

Codes. Carry out the instrument cluster self-test. • **Is DTC B1600 or B2431 still present?**	
F3 INSTALL A NEW PATS TRANSCEIVER	
• Key in OFF position. • Install a new PATS transceiver. Refer to Passive Anti-Theft System (PATS) Transceiver in this section. • **NOTE:** Use the customer's original PATS key, not the PATS key that was cut in the previous step. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Clear Continuous Codes. Carry out the instrument cluster self-test. • **Is DTC B1600 or B2431 retrieved?**	**Yes** INSTALL a new instrument cluster. REFER to Section 413-00 . TURN the key to ON using two PATS keys. Go To Pinpoint Test D to initialize the module. CLEAR the DTCs. REPEAT the self-test. If the vehicle is equipped with the valet feature, program the third key (if available) or instruct the customer on how to carry out this service. REFER to Key Programming Using Two Programmed Keys in this section. **No** The system is OK.

Pinpoint Test G: The Anti-Theft System Does Not Operate Correctly PATS Received Incorrect Key-Code From Ignition Key Transponder (Unprogrammed PATS Key)

Normal Operation

During each key insertion and vehicle start sequence, the instrument cluster and the transceiver module reads the PATS key identification code.

Possible Causes

- PATS transceiver
- instrument cluster
- PATS key

PINPOINT TEST G: THE ANTI-THEFT SYSTEM DOES NOT OPERATE CORRECTLY PATS RECEIVED INCORRECT KEY-CODE FROM IGNITION KEY TRANSPONDER (UNPROGRAMMED PATS KEY)

Test Step	Result / Action to Take
NOTE: Large metallic objects, electronic debit transponder devices or a second key on the same key ring as the PATS key may cause vehicle starting problems and record DTCs under certain conditions. If a fault cannot be identified, examine the customer's key for such objects or devices. If present, inform the customer that they need to keep these objects from touching the PATS key while starting the engine. These objects and devices cannot damage the PATS key, but can cause a momentary problem if they are too close to the key during engine start. If a problem occurs, turn key OFF and restart the engine with all other objects on the key ring held away from the PATS key. Check to ensure the PATS key used by the customer is an approved Ford PATS key (PATS keys from Rotunda, Ilco, Curtis, C.E. Marshall or Strattec are approved Ford PATS keys).	

G1 USE THE DTCS FROM THE INSTRUMENT CLUSTER SELF-TEST	
• Use the recorded instrument cluster continuous and on-demand self-test DTCs. • **Is DTC B1601 recorded?**	**Yes** GO to G2 . **No** The system is OK. CHECK all customer PATS keys with instrument cluster self-test to verify all other PATS keys are programmed.
G2 CHECK FOR PROGRAMMED PATS KEYS MONITOR THE INSTRUMENT CLUSTER PID NUMKEYS	
• Monitor the instrument cluster PID NUMKEYS. • **Does the instrument cluster PID NUMKEYS display 8?**	**Yes** ERASE and REPROGRAM the key codes. REFER to Key Programming Using Diagnostic Equipment in this section. CLEAR the DTCs. REPEAT the self-test. If the vehicle is equipped with the valet feature, program the third key (if available) or instruct the customer on how to carry out this service. REFER to Key Programming Using Two Programmed Keys in this section. **No** GO to G3 .
G3 CHECK THE NUMBER OF PROGRAMMED PATS KEYS AVAILABLE	
• Verify there are at least two currently programmed PATS keys available with the vehicle. • **Are at least two currently programmed PATS keys available with the vehicle?**	**Yes** GO to G4 . **No** CUT new PATS key(s) so that at least two PATS keys are available. PROGRAM the PATS keys; REFER to Key Programming Using Diagnostic Equipment in this section. GO to G4 .
G4 VERIFY THE INSTRUMENT CLUSTER PID SPARE_KY INDICATES ENABLE	
• Monitor the instrument cluster PID SPARE_KY. • **Does the instrument cluster PID SPARE_KY indicate enable?**	**Yes** GO to G5 . **No** ENABLE the PID SPARE KEY to the enable setting. REFER to Key Programming Using Two Programmed Keys in this section. CLEAR the DTCs. REPEAT the self-test. Once completed, GO to G5 .

G5 CHECK THE PATS KEYS FOR CORRECT OPERATION	
• Key in OFF position. • Start the vehicle using the first PATS key. • Start the vehicle with the second PATS key. • Key in OFF position. • **Does the vehicle start correctly using both PATS keys?**	**Yes** The system is OK. If there are additional keys that need to be programmed, REFER to Key Programming Using Two Programmed Keys in this section. If the vehicle is equipped with the valet feature, program the third key (if available) or instruct the customer on how to carry out this service. REFER to Key Programming Using Two Programmed Keys in this section. **No** GO to G6 .
G6 RETRIEVE THE INSTRUMENT CLUSTER DTCS CHECK FOR DTC B1601	
• Enter the following diagnostic mode on the diagnostic tool: Retrieve Instrument Cluster Continuous Codes. • Enter the following diagnostic mode on the diagnostic tool: Clear Continuous Codes. • Carry out the instrument cluster self-test using both PATS keys from Step G5. • **Is DTC B1601 retrieved?**	**Yes** INSTALL a new instrument cluster. REFER to Section 413-00 . PROGRAM the keys. REFER to Key Programming Using Diagnostic Equipment in this section. Go To Pinpoint Test D to initialize the vehicle. CLEAR the DTCs. REPEAT the self-test. If the vehicle is equipped with the valet feature, program the third key (if available) or instruct the customer on how to carry out this service. REFER to Key Programming Using Two Programmed Keys in this section. **No** The system is OK. If other DTCs are retrieved, REFER to Instrument Cluster Diagnostic Trouble Code (DTC) Index.

Pinpoint Test H: The Anti-Theft System Does Not Operate Correctly PATS Received Invalid Format Of Key-Code From PATS Key Transponder (Partial Key Read)

Normal Operation

During each key insertion and vehicle start sequence, the instrument cluster and the transceiver module reads the PATS key identification code.

Possible Causes

- PATS key
- PATS transceiver

PINPOINT TEST H: THE ANTI-THEFT SYSTEM DOES NOT OPERATE CORRECTLY PATS RECEIVED INVALID FORMAT OF KEY-CODE FROM PATS KEY TRANSPONDER (PARTIAL KEY READ)

Test Step	Result / Action to Take

NOTE: Large metallic objects, electronic debit transponder devices or a second key on the same key ring as the PATS key may cause vehicle starting problems and record DTCs under certain conditions. If a fault cannot be identified, examine the customer's key for such objects or devices. If present, inform the customer that they need to keep these objects from touching the PATS key while starting the engine. These objects and devices cannot damage the PATS key, but can cause a momentary problem if they are too close to the key during engine start. If a problem occurs, turn the key OFF and restart the engine with all other objects on the key ring held away from the PATS key. Check to ensure the PATS key used by the customer is an approved Ford PATS key (PATS keys from Rotunda, Ilco, Curtis, C.E. Marshall or Strattec are approved Ford PATS keys).	
H1 USE THE DTCS FROM THE INSTRUMENT CLUSTER SELF-TEST	
• Use the recorded instrument cluster continuous and on-demand self-test DTCs. • **Is DTC B1602 retrieved?**	**Yes** GO to H2 . **No** The system is OK. CHECK all customer PATS keys with instrument cluster self-test to verify all other PATS keys are programmed.
H2 OBTAIN A NEW PATS KEY	
• Key in OFF position. • Cut a new PATS key. • Key in ON position. • Program a new PATS key. Refer to Key Programming Using Diagnostic Equipment in this section. • Carry out the instrument cluster self-test. • **Is DTC B1602 retrieved?**	**Yes** GO to H3 . **No** The system is OK.
H3 INSTALL A NEW PATS TRANSCEIVER	
• Key in OFF position. • Install a new PATS transceiver. Refer to Passive Anti-Theft System (PATS) Transceiver in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Clear Continuous Codes. Carry out the instrument cluster self-test. • **Are any DTCs retrieved?**	**Yes** REFER to Instrument Cluster Diagnostic Trouble Code (DTC) Index. **No** The system is OK.

Pinpoint Test I: The Anti-Theft System Does Not Operate Correctly PATS Transceiver Signal Is Not Received (Not Connected, Damaged, Or Wiring)

Normal Operation

During each key insertion and vehicle start sequence, the instrument cluster and the transceiver module reads the PATS key identification code.

Possible Causes

- PATS transceiver
- instrument cluster
- PATS key
- circuit 29S-GL36 (OG/BU) open or short to ground
- circuit 31-GL36 (BK) open or short to power
- circuit 10-GL36 (GY/RD) open or short to ground
- circuit 8-GL36 (WH/RD) open or short to ground

PINPOINT TEST I: THE ANTI-THEFT SYSTEM DOES NOT OPERATE CORRECTLY PATS TRANSCEIVER SIGNAL IS NOT RECEIVED (NOT CONNECTED, DAMAGED, OR WIRING)

Test Step	Result / Action to Take
I1 USE THE DTCS FROM THE INSTRUMENT CLUSTER SELF-TEST	
• Use the recorded instrument cluster continuous and on-demand self-test DTCs. • **Is DTC B1681 retrieved?**	**Yes** GO to I2 . **No** The system is OK.
I2 INSPECT THE PATS TRANSCEIVER FOR CORRECT INSTALLATION	
• Key in OFF position. • Verify the PATS transceiver is correctly installed. Refer to Passive Anti-Theft System (PATS) Transceiver in this section. • **Was the transceiver correctly installed?**	**Yes** GO to I3 . **No** Correct the installation. CLEAR the DTCs. REPEAT the self-test.
I3 CHECK THE PATS TRANSCEIVER FOR VOLTAGE CIRCUIT 29S-GL36 (OG/BU)	
• Key in OFF position. • Disconnect: PATS Transceiver C252. • Key in ON position. • Measure the voltage between PATS transceiver C252-1, circuit 29S-GL36 (OG/BU), harness side and ground.  A0003898 • **Is the voltage greater than 9 volts?**	**Yes** GO to I4 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
I4 CHECK THE PATS TRANSCEIVER GROUND CIRCUIT 31-GL36 (BK)	

• Key in OFF position. • Measure the resistance between PATS transceiver C252-2, circuit 31-GL36 (BK), harness side and ground.  A0003899 • **Is the resistance less than 5 ohms?**	**Yes** GO to I5 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
I5 CHECK THE PATS TRANSCEIVER RECEIVE CIRCUIT FOR VOLTAGE CIRCUIT 10-GL36 (GY/RD)	
• Connect: PATS Transceiver C252. • Key in ON position. • Measure the voltage by back-probing between PATS transceiver C252-4, circuit 10-GL36 (GY/RD), harness side and ground.  A0003900 • **Is the voltage greater than 9 volts?**	**Yes** GO to I7 . **No** GO to I6 .
I6 CHECK THE PATS TRANSCEIVER RECEIVE CIRCUIT FOR SHORT TO GROUND CIRCUIT 10-GL36 (GY/RD)	
• Key in OFF position. • Disconnect: PATS Transceiver C252. • Measure the resistance between PATS transceiver C252-4, circuit 10-GL36 (GY/RD), harness side and ground.  A0003901 • **Is the resistance greater than 100 ohms?**	**Yes** GO to I7 . **No** CHECK circuit 10-GL36 (GY/RD) for short to ground with instrument cluster disconnected. If the circuit is OK, INSTALL a new instrument cluster. REFER to Section 413-00 . PROGRAM the keys. REFER to Key Programming Using Diagnostic Equipment in this section. Go To Pinpoint Test D to initialize the module. CLEAR the DTCs. TEST the system for normal operation. If the circuit is not OK, REPAIR circuit 10-GL36 (GY/RD). CLEAR the DTCs. REPEAT the self-test. If the vehicle is

	equipped with the valet feature, program the third key (if available) or instruct the customer on how to carry out this service. REFER to Key Programming Using Two Programmed Keys in this section.
I7 CHECK CIRCUIT 10-GL36 (GY/RD) FOR OPEN	
• Key in OFF position. • Disconnect: PATS Transceiver C252. • Disconnect: Instrument Cluster C220b. • Measure the resistance between PATS transceiver C252-4, circuit 10-GL36 (GY/RD), harness side and instrument cluster C220b-5, circuit 10-GL36 (GY/RD), harness side.  A0003902 • **Is the resistance less than 5 ohms?**	**Yes** GO to I8 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
I8 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT FOR VOLTAGE CIRCUIT 8-GL36 (WH/RD)	
• Key in OFF position. • Connect: PATS Transceiver C252. • Connect: Instrument Cluster C220b. • Key in ON position. • Measure the voltage by back-probing between PATS transceiver C252-3, circuit 8-GL36 (WH/RD), harness side and ground.  A0003903 • **Is the voltage greater than 9 volts?**	**Yes** GO to I10 . **No** GO to I9 .
I9 CHECK THE PATS TRANSCEIVER TRANSMIT CIRCUIT FOR OPEN CIRCUIT 8-GL36 (WH/RD)	
• Key in OFF position. • Disconnect: PATS Transceiver C252. • Measure the resistance between PATS transceiver C252-3, circuit 8-GL36 (WH/RD), harness side and ground.	**Yes** GO to I10 . **No** CHECK circuit 8-GL36 (WH/RD) for short to ground with instrument cluster disconnected. If the circuit is OK, INSTALL a new

 A0003904 • **Is the resistance greater than 100 ohms?**	instrument cluster. REFER to Section 413-00 . PROGRAM the keys. REFER to Key Programming Using Diagnostic Equipment in this section. Go To Pinpoint Test D to initialize the module. TEST the system for normal operation. If the vehicle is equipped with the valet feature, program the third key (if available) or instruct the customer on how to carry out this service. REFER to Key Programming Using Two Programmed Keys in this section. If the circuit is not OK, REPAIR circuit 8-GL36 (WH/RD). CLEAR the DTCs. REPEAT the self-test.
I10 CHECK THE PATS TRANSMIT CIRCUIT FOR CORRECT OPERATION CIRCUIT 8-GL36 (WH/RD)	
• Connect: PATS Transceiver C252. • Trigger the instrument cluster active command RF_ SIGNAL to ON while measuring the voltage by back probing between PATS transceiver C252-3, circuit 8-GL36 (WH/RD), harness side and ground.  A0003903 • **Does the voltage drop from greater than 9 volts to less than 1 volt when the instrument cluster active command RF_ SIGNAL is triggered ON?**	**Yes** GO to I11 . **No** CHECK circuit 8-GL36 (WH/RD) for an open between instrument cluster C220b-4 and PATS transceiver C252-3. If the circuit is OK, INSTALL a new instrument cluster. REFER to Section 413-00 . PROGRAM the keys. REFER to Key Programming Using Diagnostic Equipment in this section. Go To Pinpoint Test D to initialize the module. TEST the system for normal operation. If the vehicle is equipped with the valet feature, program the third key (if available) or instruct the customer on how to carry out this service. REFER to Key Programming Using Two Programmed Keys in this section. If the circuit is not OK, REPAIR circuit 8-GL36 (WH/RD). CLEAR the DTCs. REPEAT the self-test.
I11 CHECK THE PATS SYSTEM WITH A NEW PATS TRANSCEIVER INSTALLED	
• Key in OFF position. • Install a new PATS transceiver. Refer to Passive Anti-Theft System (PATS) Transceiver in this section. • Key in ON position. • Carry out the instrument cluster self-test. • **Is DTC B1681 retrieved?**	**Yes** GO to I12 . **No** The system is OK.

I12 CHECK THE PATS SYSTEM WITH A NEW INSTRUMENT CLUSTER	
• Key in OFF position. • Install a new instrument cluster. Refer to Section 413-00 . Cycle the key to ON using two PATS keys. Program the keys. Refer to Key Programming Using Diagnostic Equipment in this section. Go To Pinpoint Test D to initialize the module. If the vehicle is equipped with the valet feature, program the third key (if available) or instruct the customer on how to carry out this service. REFER to Key Programming Using Two Programmed Keys in this section. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Clear Continuous Codes. • Carry out the instrument cluster self-test. • **Is DTC B1681 retrieved?**	**Yes** REPAIR circuits 8-GL36 (WH/RD), 10-GL36 (GY/RD), 29S-GL36 (OG/BU), and 31-GL36 (BK). CLEAR the DTCs. REPEAT the self-test. **No** If no DTCs are retrieved, the system is OK.

Pinpoint Test J: The Anti-Theft System Does Not Operate Correctly Antenna Not Connected Or Defective Transceiver

Normal Operation

During each key insertion and vehicle start sequence, the instrument cluster and the transceiver module reads the PATS key identification code.

Possible Causes

- PATS transceiver

PINPOINT TEST J: THE ANTI-THEFT SYSTEM DOES NOT OPERATE CORRECTLY ANTENNA NOT CONNECTED OR DEFECTIVE TRANSCEIVER

Test Step	Result / Action to Take
J1 INSPECT THE PATS TRANSCEIVER FOR CORRECT INSTALLATION	
• Key in OFF position. • Verify the PATS transceiver is correctly installed. REFER to Passive Anti-Theft System (PATS) Transceiver in this section. • Carry out the instrument cluster self-test. • **Is DTC B2103 retrieved?**	**Yes** INSTALL a new PATS transceiver module. REFER to Passive Anti-Theft System (PATS) Transceiver in this section. CLEAR the DTCs. REPEAT the self-test. **No** The system is OK.

Pinpoint Test K: The Vehicle Does Not Start Theft Indicator Does Not Prove Out And Flashes Rapidly

Normal Operation

During each key insertion and vehicle start sequence, the instrument cluster and the transceiver module reads the PATS key identification code.

Possible Causes

- PATS transceiver
- instrument cluster
- PATS key

PINPOINT TEST K: THE VEHICLE DOES NOT START THEFT INDICATOR DOES NOT PROVE OUT AND FLASHES RAPIDLY

Test Step	Result / Action to Take
K1 RECORD THE DTCS FROM THE INSTRUMENT CLUSTER SELF-TEST	
• Key in ON position. • Carry out the instrument cluster self-test. • Use the recorded instrument cluster self-test. • **Is instrument cluster DTC B1213, B1600, B1601, 1602, B1681, B2103, B2139, B2141, B2431 or U1147 retrieved?**	**Yes** REPAIR the instrument cluster DTC. REFER to the Instrument Cluster Diagnostic Trouble Code (DTC) Index. CLEAR the DTCs. REPEAT the self-test. **No** GO to K2 .
K2 CHECK FOR THEFT INDICATOR FLASHING FAULT CODE SEQUENCE 16	
• **NOTE:** The sequence 1-6 will repeat itself. • Check for flashing fault code 16 on the theft indicator. • **When turning key to RUN, does the theft indicator flash rapidly for one minute, pause briefly, flash one time, pause briefly and then flash 6 times?**	**Yes** GO to K3 . **No** CHECK for other no-start fault.
K3 CARRY OUT PCM DIAGNOSTICS	
• Carry out diagnostics on the PCM module. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new instrument cluster. REFER to Section 413-00 . PROGRAM the keys. REFER to Key Programming Using

• **Does a PCM module concern exist?**	Diagnostic Equipment in this section. Go To Pinpoint Test D to initialize the module. TEST the system for normal operation. If the vehicle is equipped with the valet feature, program the third key (if available) or instruct the customer on how to carry out this service. REFER to Key Programming Using Two Programmed Keys in this section.

Anti-Theft Perimeter Printable View (228 KB)

Refer to Wiring Diagrams Cell 112 , Anti-Theft for schematic and connector information.

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052 or equivalent diagnostic tool with appropriate adapter cable

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical and electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Hood switch • Driver door arm/disarm switch(es) • Luggage compartment lid disarm switch • Ignition switch • Vehicle horn • Door ajar switches • Luggage compartment switch	• Central junction box (CJB) fuses: ♦ 5 (5A) ♦ 7 (5A) • Battery junction box (BJB) fuses: ♦ 22 (20A) ♦ 25 (40A) • FEM • REM • DDM • Connectors • Circuitry

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the cause is not visually evident, connect the diagnostic tool to the data link connector and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
    - check that the program card is correctly installed.
    - check the connections to the vehicle.
    - check the key switch position.

5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

6. Carry out the diagnostic tool data link test. If the diagnostic tool responds with:
    - SCP+, SCP- or UBP circuit fault; all electronic control units no response/not equipped, refer to Section 418-00 .
    - No response/not equipped for front electronic module (FEM), refer to Section 418-00 .
    - No response/not equipped for rear electronic module (REM), refer to Section 418-00 .
    - No response/not equipped for driver door module (DDM), refer to Section 418-00 .
    - System passed, select FEM, REM and DDM from the main menu, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out self-test diagnostics for the FEM, REM and DDM.

7. If the DTCs retrieved are related to the concern, go to the FEM Diagnostic Trouble Code (DTC) Index, REM Diagnostic Trouble Code (DTC) Index, or DDM Diagnostic Trouble Code (DTC) Index to continue diagnostics.

8. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

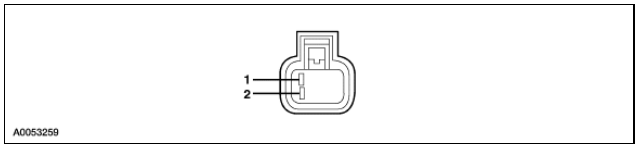
Symptom Chart

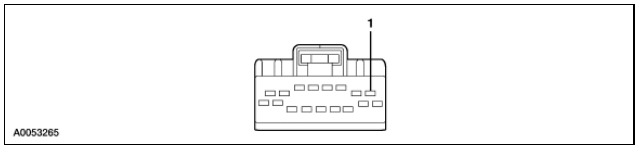
Symptom Chart
Connector Circuit Reference

Hood Ajar Switch C127



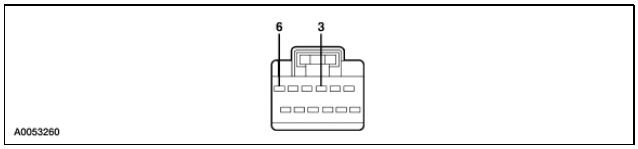
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	8-GL7 (WH) FEM to hood ajar switch circuit	Less than 5 ohms between FEM and hood ajar switch, Greater than 10,000 ohms to ground with the FEM and the hood ajar switch disconnected.
2	31-GL7 (BK/YE) ground circuit for hood ajar switch	0 volts, less than 5 ohms to ground with the hood ajar switch disconnected.

FEM C201a



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	29S-DK21 (OG/WH) power feed for the FEM	12 volts to FEM with key ON, greater than 10, 000 ohms to ground with the FEM disconnected.

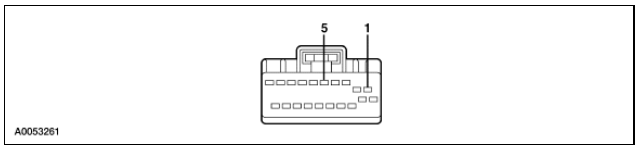
FEM C201c



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
3	8-GL7 (WH) signal circuit from the hood ajar switch	0 ohms between the FEM and the hood ajar switch, greater than 10,000 ohms to ground with the FEM and the hood ajar switch disconnected.
6		

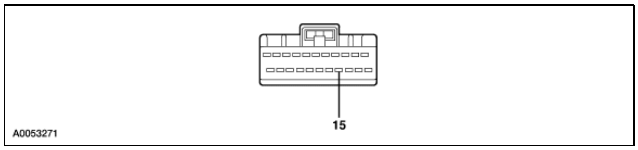
	29-DK20 (OG/GN) power feed to the FEM	12 volts to FEM with key ON, greater than 10, 000 ohms to ground with the FEM disconnected.

FEM C201f



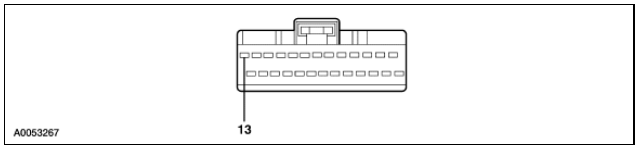
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	29S-DK22 (OG/YE) power feed to the FEM	12 volts with key in the ON position, greater than 10,000 ohms to ground with the FEM disconnected.
5	91S-GL13 (BK/YE) ground circuit for the FEM	0 volts, less than 5 ohms to ground with the FEM disconnected.

REM C420b



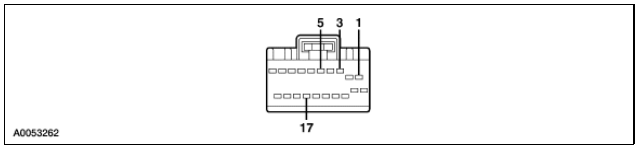
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
15	8-GL27 (WH/BU) signal feed from the luggage compartment switch to the DDM	Less than 5 ohms between the luggage compartment switch and the REM, greater than 10,000 ohms to ground with the REM and the luggage compartment switch disconnected.

REM C420c



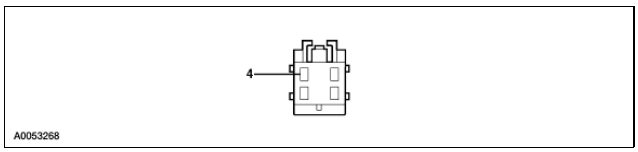
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
13	29S-DK31 (OG/BK) power feed to the REM	12 volts with key in the ON position, greater than 10,000 ohms to ground with the REM disconnected.

REM C420d



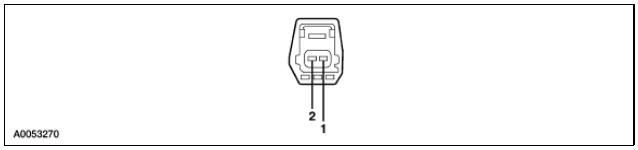
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	15S-DK32 (GN/RD) power feed to the REM	12 volts with key in the ON position, greater than 10,000 ohms to ground with the REM disconnected.
3	29-DK31 (OG/BK) power feed to the REM	12 volts with key in the ON position, greater than 10,000 ohms to ground with the REM disconnected.
5	91S-GL13 (BN) REM security output to the FEM	Less than 5 ohms resistance between REM and FEM with the REM and the FEM disconnected.
17	31S-GL19 (BK/GN) right rear door ajar status circuit	Less than 5 ohms between right rear door latch and REM, greater than 10,000 ohms to ground with the REM and the right rear door latch disconnected.

REM C420f, C420g



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
4 (C420f)	30-DK30A (BK) power feed to the REM	12 volts with key in the ON position, greater than 10,000 ohms to ground with the REM disconnected.
4 (C420g)	30-DK30 (RD) power feed to the REM	12 volts with key in the ON position, greater than 10,000 ohms to ground with the REM disconnected.

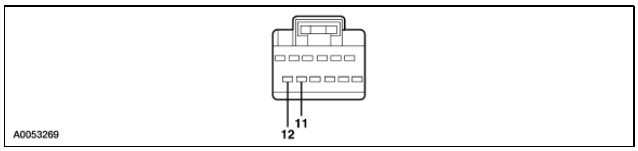
Luggage Compartment Lid Disarm Switch C483



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	31-GL27 (BK/OG) ground circuit for the luggage compartment switch	0 voltage, less than 5 ohms to ground with luggage compartment lid disarm switch disconnected.
2	8-GL27 (WH/BU) signal feed from the luggage compartment switch to the REM	Less than 5 ohms between the luggage compartment lid switch and the REM, greater than 10,000 ohms to ground with the REM and the luggage compartment switch

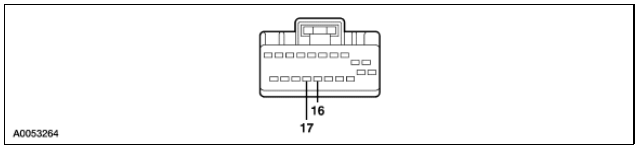
		disconnected.

DDM C501a



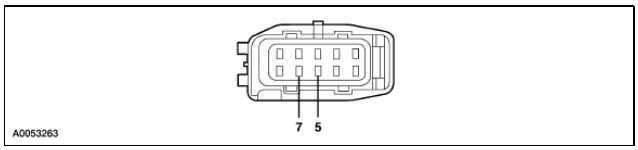
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
11	29-AJ80 (OG) power feed for the DDM	12 volts with key in the ON position, greater than 10,000 ohms to ground with the DDM disconnected.
12	29S-AJ86 (OG/BU) power feed for the DDM	12 volts with key in the ON position, greater than 10,000 ohms to ground with the DDM disconnected.

DDM C501c



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
16	31S-AA78 (BK/BU) driver set circuit	Less than 5 ohms between the driver door latch and the DDM, greater than 10,000 ohms to ground with the DDM and the driver door latch disconnected.
17	31S-AA79 (BK/WH) driver reset switch circuit	Less than 5 ohms between the driver door latch and the DDM, greater than 10,000 ohms to ground with the DDM and the driver door latch disconnected.

Drivers Door Lock Actuator C525



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
5	31S-AA79 (BK/WH) driver reset switch circuit	Less than 5 ohms between the driver door latch and the DDM, greater than 10,000 ohms to ground with the DDM and the driver door latch disconnected.
7	31S-AA78 (BK/BU) driver set switch circuit	Less than 5 ohms between the driver door latch and the DDM, greater than 10,000 ohms to ground with the DDM and the driver door latch disconnected.

Pinpoint Test L: The Anti-Theft System Does Not Operate Correctly Lights Flash Five Times When Arming The System

Normal Operation

The ajar switches are monitored by the REM and FEM. When an arm request is received by the FEM the switch positions are queried, and if any door, hood, or luggage compartment lid is ajar, then lights flash five times.

If the doors are locked with the keyless remote and the lock button is pressed and second time, the horn will chirp twice to indicate that a door, decklid or hood is ajar.

Possible Causes

- Ignition Switch
- CJB fuse 5 (5A)
- luggage compartment lid ajar switch
- hood ajar switch
- door ajar switch
- FEM
- REM
- circuit 8-GL7 (WH) open or short to ground
- circuit 31-GL7 (BK/YE) open or short to power

PINPOINT TEST L: THE ANTI-THEFT SYSTEM DOES NOT OPERATE CORRECTLY LIGHTS FLASH FIVE TIMES WHEN ARMING THE SYSTEM

Test Step	Result / Action to Take
L1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TEST FEM	
• Use the recorded FEM DTCs from the continuous and on-demand self-test. • **Are any FEM DTCs recorded?**	**Yes** If DTC B1519, GO to L5 . For all other FEM DTCs, REFER to the FEM Diagnostic Trouble Code (DTC) Index. **No** GO to L2 .
L2 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TEST REM	
• Use the recorded REM DTCs from the continuous and on-demand self-test. • **Are any REM DTCs recorded?**	**Yes** REFER to the REM Diagnostic Trouble Code (DTC) Index. **No** GO to L3 .

L3 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TEST DDM	
• Use the recorded DDM DTCs from the continuous and on-demand self-test. • **Are any DDM DTCs recorded?**	**Yes** REFER to the DDM Diagnostic Trouble Code (DTC) Index. **No** GO to L4 .
L4 CHECK THE INTERIOR COURTESY LAMP OPERATION	
• Open and close each door, while observing the interior courtesy lamps. • Open and close the luggage compartment lid, while observing the luggage compartment lamp. • **Do the courtesy lamps operate correctly?**	**Yes** GO to L5 . **No** REFER to Section 417-02 .
L5 CHECK FOR A FAULTY HOOD AJAR SWITCH	
• Key in ON position. • Disconnect: Hood Ajar Switch C127. • Monitor the FEM PID HOOD_SW, while connecting a fused jumper wire between hood ajar switch C127-1, circuit 8-GL7 (WH), harness side and hood ajar switch C127-2, circuit 31-GL7 (BK/YE), harness side.  A0003769 • **Does the FEM PID HOOD_SW change from ajar to closed?**	**Yes** INSTALL a new hood ajar switch. CLEAR the DTCs. REPEAT the self-test. **No** GO to L6 .
L6 CHECK CIRCUIT 31S-GL7 (BK/YE) FOR AN OPEN	
• Disconnect: Hood Ajar Switch C127. • Measure the resistance between hood ajar switch C127-2, circuit 31-GL7 (BK/YE), harness side and ground.  A0003770 • **Is the resistance less than 5 ohms?**	**Yes** GO to L7 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
L7 CHECK CIRCUIT 8-GL7 (WH) FOR AN OPEN	
• Disconnect: FEM C201c. • Measure the resistance between hood ajar switch C127-1, circuit 8-GL7 (WH), harness side and FEM C201c-3, circuit 8-GL7 (WH) harness side.	**Yes** GO to L8 . **No** REPAIR the circuit. CLEAR the DTCs.

 A0003771 • **Is the resistance less than 5 ohms?**	REPEAT the self-test.
L8 CHECK CIRCUIT 91S-GL13 (BK/YE) FOR SHORT TO BATTERY	
• Disconnect: FEM C201f. • Measure the voltage between FEM C201f-5, circuit 91S-GL13 (BK/YE), harness side and ground.  A0003766 • **Is the voltage greater than 10 volts?**	**Yes** GO to L9 . **No** GO to L10 .
L9 CHECK REM FOR AN INTERNAL SHORT TO BATTERY	
• Key in OFF position. • Disconnect: REM C420d. • Key in ON position. • Measure the voltage between FEM C201f-5, circuit 91S-GL13 (BK/YE), harness side and ground.  A0003766 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** INSTALL a new REM. REFER to Section 418-00 . TEST the system for normal operation.
L10 CHECK REM OPERATION	
• Key in OFF position. • Disconnect: FEM C201f. • Disconnect: REM C420d. • Using a fused jumper wire, jumper REM C420d-5, circuit 91S-GL13 (BN) to ground. Using a second fused jumper wire, jumper REM C420d-17, circuit 31S-GL19 (BK/GN) to ground.  A0006303 • Close all doors, hood and luggage compartment lid.	**Yes** Remove jumper wires. GO to L11 . **No** INSTALL a new REM. REFER to Section 418-00 . TEST the system for normal operation.

• Arm the anti-theft system. • **Do the lights flash five times when the system is armed?**	
L11 CHECK CIRCUIT 91S-GL13 (BK/YE) FOR AN OPEN	
• Disconnect: FEM C201f. • Measure the resistance between FEM C201f-5, circuit 91S-GL13 (BK/YE), harness side and REM C420d-5, circuit 91S-GL13 (BK/YE), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new FEM. REFER to Section 418-00 . CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test M: The Alarm System Does Not Arm/Disarm Using The Driver Set Switch

Normal Operation

The driver arm/disarm switch grounds either circuit 31S-AA78 or 31S-AA79 to the DDM. The DDM then communicates over the SCP network to the FEM to arm/disarm the alarm system.

Possible Causes

- switch
- DDM
- circuit 31S-AA79 (BK/WH) short to ground
- circuit 31S-AA78 (BK/BU) short to ground

PINPOINT TEST M: THE ALARM SYSTEM DOES NOT ARM/DISARM USING THE DRIVER SET SWITCH

Test Step	Result / Action to Take
M1 RETRIEVE THE RECORDED DTC CODES DDM	
• Use the recorded DDM DTCs from the continuous and on-demand self-test. • **Are any DDM DTCs recorded?**	**Yes** If DTC B2112 or B2116, GO to M3 . **No** GO to M2 .
M2 CHECK THAT THE DRIVER DOOR LOCK AND UNLOCK PIDS READ CORRECTLY	
• Monitor the DDM PIDs D_DSRM and DRLKCYL while turning the key in the driver door lock cylinder to the LOCK and UNLOCK positions. • **Do the DDM PID values agree with the LOCK positions?**	**Yes** INSTALL a new DDM. REFER to Section 418-00 . TEST the system for normal operation. **No** GO to M5 .

M3 CHECK CIRCUIT 31S-AA78 (BK/BU) AND 31S-AA79 (BK/WH) FOR SHORT TO GROUND	
• Key in OFF position. • Disconnect: Driver Door Lock Actuator C525. • Measure the resistance between driver door lock actuator C525-5, circuit 31S-AA79 (BK/WH) harness side and ground; and between driver door lock actuator C525-7, circuit 31S-AA78 (BK/BU) harness side and ground.  A0003772 • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new driver door lock actuator/ajar switch. REFER to Section 501-14 . CLEAR the DTCs. REPEAT the self-test. **No** GO to M4 .
M4 CHECK THE DDM FOR INTERNAL SHORT TO GROUND	
• Disconnect: DDM C501c. • Measure the resistance between DDM C501c-16, circuit 31S-AA78 (BK/BU), harness side and ground; and between DDM C501c-17, circuit 31S-AA79 (BK/WH), harness side and ground.  A0003773 • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new DDM. REFER to Section 418-00 . TEST the system for normal operation. **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
M5 CHECK THE DRIVER SET AND DRIVER RESET SWITCH	
• Monitor the DDM PIDs D_DSRM and DRLKCYL while connecting a jumper wire between the driver door ajar switch C525-5, circuit 31S-AA79 (BK/WH) harness side and ground; and between driver door ajar switch C525-7, circuit 31S-AA78 (BK/BU) harness side and ground.  A0003774 • **Do the DDM PID values agree with the LOCK positions?**	**Yes** INSTALL a new driver door lock actuator/ajar switch. REFER to Section 501-14 . CLEAR the DTCs. REPEAT the self-test. **No** GO to M6 .
M6 CHECK CIRCUITS 31S-AA78 (BK/BU) AND 31S-AA79 (BK/WH)	

• Measure the resistance between DDM C501c-16, circuit 31S-AA78 (BK/BU), harness side and driver door ajar switch C525-7, circuit 31S-AA78 (BK/BU), harness side: and DDM C501c-17, circuit 31S-AA79 (BK/WH), harness side and driver door ajar switch C525-5, circuit 31S-AA79 (BK/WH), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new DDM. REFER to Section 418-00 . TEST the system for normal operation. **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test N: The Alarm System Does Not Arm/Disarm Using The Remote Transmitter

Normal Operation

The remote transmitter triggers the DDM to arm/disarm the alarm system.

Possible Causes

- transmitter
- DDM

PINPOINT TEST N: THE ALARM SYSTEM DOES NOT ARM/DISARM USING THE REMOTE TRANSMITTER

Test Step	Result / Action to Take
N1 CHECK THE ALARM SYSTEM USING THE DRIVER SET SWITCH	
• ARM and DISARM the alarm system using the driver set switch. • **Does the alarm system set and reset correctly?**	**Yes** GO to N2 . **No** Go To Pinpoint Test M .
N2 DETERMINE IF DDM IS RECEIVING CORRECT UNLOCK COMMANDS FROM THE KEY FOB	
• Remove the key from the ignition. • Monitor the DDM function test tic data, while pressing the lock and unlock buttons on the remote transmitter. • **Does last data received match the button pressed of the remote transmitter?**	**Yes** INSTALL a new DDM. REFER to Section 418-00 . TEST the system for normal operation. **No** GO to N3 .
N3 INSTALL A NEW BATTERY IN THE REMOTE TRANSMITTER AND RETEST	
• Install a new battery in the remote transmitter. • Monitor the DDM function test tic data, while pressing the lock and unlock buttons on the	**Yes** Fault found as low battery. TEST the system for normal operation.

remote transmitter. • **Does last data received match the button pressed of the remote transmitter?**	**No** GO to N4 .
N4 REPROGRAM REMOTE TRANSMITTER TO DDM	
NOTE: When carrying out the following procedure, it must be noted that all previous programmed remote transmitters will be erased. The customer needs to be informed that any remote transmitters not present during the programming mode will not operate the vehicle. All remote transmitters must be programmed at the same time. Reprogram the remote transmitter to the DDM. Refer to Section 501-14 . • Monitor the DDM function test tic data while pressing the lock and unlock buttons on the remote transmitter. • **Does last data received match the button pressed of the remote transmitter?**	**Yes** The system is OK. CLEAR the DTCs. REPEAT the self-test. **No** PROGRAM a new remote transmitter to the vehicle. REFER to Section 501-14 . CLEAR the DTCs. REPEAT the self-test. If the problem still remains, INSTALL a new DDM and program the remote transmitter to the vehicle. REFER to Section 418-00 . TEST the system for normal operation.

Pinpoint Test O: Battery Voltage Out Of Range FEM

Normal Operation

The FEM arms/disarms the alarm system. The FEM receives voltage over circuits 29-DK22 (OG/YE) and 29-DK20 (OG/GN), 29S-DK21 (OG/WH).

Possible Causes

- FEM
- circuit 29-DK22 (OG/YE) open or short to ground
- circuit 29-DK20 (OG/GN) open or short to ground
- circuit 29S-DK21 (OG/WH) open or short to ground

PINPOINT TEST O: BATTERY VOLTAGE OUT OF RANGE FEM

Test Step	Result / Action to Take
O1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TEST FEM	
• Use the recorded FEM DTCs from the continuous and on-demand self-test. • **Are any FEM DTCs recorded?**	**Yes** If DTC B1676, GO to O2 . **No** GO to O3 .
O2 CHECK PID FOR BATTERY VOLTAGE	
NOTE: Turn the key from OFF to ON to enable the switched system power feature.	**Yes** RUN self-test. If DTC B1676 is still present, INSTALL a new FEM. REFER to Section

• Key in ON position. • Monitor the FEM PID VBAT. • **Is the voltage between 9 and 16 volts?**	418-00 . TEST the system for normal operation. **No** GO to O3 .
O3 CHECK VOLTAGE SUPPLY TO THE MODULE	
• Key in OFF position. • Disconnect: FEM C201f. • Disconnect: FEM C201c. • Disconnect: FEM C201a. • Key in ON position. • Using the following table, measure the voltage between FEM connectors, harness side and ground: **FEM Connector-Pin** / **Circuit** C201f-1 / 29-DK22 (OG/YE) C201c-6 / 29-DK20 (OG/GN) C201a-1 / 29S-DK21 (OG/WH)  A0072686 • **Are the voltages between 9 and 16 volts?**	**Yes** INSTALL a new FEM. REFER to Section 418-00 . TEST the system for normal operation. **No** REFER to Section 414-00 for further battery system diagnosis.

Pinpoint Test P: Battery Voltage Out Of Range REM

Normal Operation

The REM monitors the rear door ajar and luggage compartment lid ajar switch and transmits the ajar status to the FEM through the SCP network. The REM receives voltage over circuits 15S-DK32 (GN/RD), 29-DK31 (OG/BK), 29S-DK31 (OG/BK), 30-DK30A (BK) and 30-DK30 (RD).

Possible Causes

- REM
- circuit 15S-DK32 (GN/RD) open or short to ground
- circuit 29-DK31 (OG/BK) open or short to ground
- circuit 29S-DK31 (OG/BK) open or short to ground
- circuit 30-DK30A (BK) open or short to ground

- circuit 30-DK30 (RD) open or short to ground

PINPOINT TEST P: BATTERY VOLTAGE OUT OF RANGE REM

Test Step	Result / Action to Take
P1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TEST REM	
• Use the recorded REM DTCs from the continuous and on-demand self-test. • **Are any DTCs recorded?**	**Yes** If DTC B1676, GO to P2 . **No** GO to P3 .
P2 CHECK PID FOR BATTERY VOLTAGE	
NOTE: Turn the key from OFF to ON to enable the switched system power feature. • Key in ON position. • Monitor the REM PID VBAT. • **Is the voltage between 9 and 16 volts?**	**Yes** RUN self-test. If DTC B1676 is still present, INSTALL a new REM. REFER to Section 418-00 . TEST the system for normal operation. **No** GO to P3 .
P3 CHECK VOLTAGE SUPPLY TO THE MODULE	
• Key in OFF position. • Disconnect: REM C420d. • Disconnect: REM C420c. • Disconnect: REM C420f. • Disconnect: REM C420g. • Key in ON position. • Using the following table, measure the voltage between REM connectors, harness side and ground:	**Yes** INSTALL a new REM. REFER to Section 418-00 . TEST the system for normal operation. **No** REFER to Section 414-00 for further battery system diagnosis.

REM Connector-Pin	Circuit
C420d-1	15S-DK32 (GN/RD)
C420d-3	29-DK31 (OG/BK)
C420c-13	29S-DK31 (OG/BK)
C420f-4	30-DK30A (BK)
C420g-4	30-DK30 (RD)

 • **Are the voltages between 9 and 16 volts?**	

Pinpoint Test Q: Battery Voltage Out Of Range DDM

Normal Operation

The DDM transmits an arm/disarm signal through the SCP network to the FEM. The DDM receives voltage on circuits 29-AJ80 (OG) and 29S-AJ86 (OG/BU)

Possible Causes

- DDM
- circuit 29-AJ80 (OG) open or short to ground
- circuit 29S-AJ86 (OG/BU) open or short to ground

PINPOINT TEST Q: BATTERY VOLTAGE OUT OF RANGE DDM

Test Step	Result / Action to Take
Q1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TEST DDM	
• Use the recorded DDM DTCs from the continuous and on-demand self-test. • **Are any DTCs recorded?**	**Yes** If DTC B1676, GO to Q2 . **No** GO to Q3 .
Q2 CHECK PID FOR BATTERY VOLTAGE	
NOTE: Turn the key from OFF to ON to enable the switched system power feature. • Key in ON position. • Monitor the DDM PID VBAT. • **Is the voltage between 9 and 16 volts?**	**Yes** RUN self-test. If DTC B1676 is still present, INSTALL a new DDM. REFER to Section 418-00 . TEST the system for normal operation. **No** GO to Q3 .
Q3 CHECK VOLTAGE SUPPLY TO THE MODULE	

• Key in OFF position. • Disconnect: DDM C501a. • Disconnect: DDM C501b. • Key in ON position. • Using the following table, measure the voltage between DDM connectors, harness side and ground: **DDM Connector-Pin** / **Circuit** C501a-11 / 29-AJ80 (OG) C501a-12 / 29S-AJ86 (OG/BU)  • **Are the voltages between 9 and 16 volts?**	**Yes** INSTALL a new DDM. REFER to Section 418-00 . TEST the system for normal operation. **No** REFER to Section 414-00 for further battery system diagnosis.

Pinpoint Test R: The Alarm System Does Not Operate Correctly Alarm Does Not Activate With Hood Ajar/Open

Normal Operation

The FEM monitors the hood ajar switch to indicate an open hood. The alarm will not activate if the switch is closed and the circuit is grounded.

Possible Causes

- hood ajar switch
- FEM
- circuit 8-GL7 (WH) short to ground

PINPOINT TEST R: THE ALARM SYSTEM DOES NOT OPERATE CORRECTLY ALARM DOES NOT ACTIVATE WITH HOOD AJAR/OPEN

Test Step	Result / Action to Take
R1 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TEST FEM	
• Use the recorded FEM DTCs from the continuous and on-demand self-test. • **Are any FEM DTCs recorded?**	**Yes** If DTC B1519, Go To Pinpoint Test L . For all other FEM DTCs, REFER to the FEM Diagnostic Trouble Code (DTC) Index. **No**

	GO to R2 .
R2 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TEST REM	
• Use the recorded REM DTCs from the continuous and on-demand self-test. • **Are any REM DTCs recorded?**	**Yes** REFER to the REM Diagnostic Trouble Code (DTC) Index. **No** GO to R3 .
R3 RETRIEVE THE RECORDED DTCS FROM BOTH CONTINUOUS AND ON-DEMAND SELF-TEST DDM	
• Use the recorded DDM DTCs from the continuous and on-demand self-test. • **Are any DDM DTCs recorded?**	**Yes** REFER to the DDM Diagnostic Trouble Code (DTC) Index. **No** GO to R4 .
R4 CHECK HOOD AJAR SWITCH OPERATION	
• Key in ON position. • Close the hood. • Monitor the FEM PID HOOD_SW while opening the hood. • **Does the FEM PID HOOD_SW change from closed to ajar?**	**Yes** CHECK for sticking hood ajar switch. TEST the system for normal operation. **No** GO to R5 .
R5 CHECK FOR A FAULTY HOOD AJAR SWITCH	
• Monitor the FEM PID HOOD_SW. • Disconnect: Hood Ajar Switch, C127. • **Does the FEM PID HOOD_SW change when hood ajar switch is disconnected?**	**Yes** INSTALL a new hood ajar switch. CLEAR the DTCs. REPEAT the self-test. **No** GO to R6 .
R6 CHECK CIRCUIT 8-GL7 (WH) FOR AN OPEN	
• Disconnect: FEM C201c. • Measure the resistance between hood ajar switch C127-1, circuit 8-GL7 (WH), harness side and ground.  A0063165 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new FEM. REFER to Section 418-00 . TEST the system for normal operation. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test S: The Alarm System Does Not Operate Correctly Luggage Compartment Lid Disarm Switch

Normal Operation

The alarm system can be suspended for the luggage compartment by using the luggage compartment disarm switch. The switch position is monitored by the REM.

Possible Causes

- luggage compartment lid disarm switch
- REM
- circuit 8-GL27 (WH/BU) open or short to ground
- circuit 31-GL27 (BK/OG) open or short to ground

PINPOINT TEST S: THE ALARM SYSTEM DOES NOT OPERATE CORRECTLY LUGGAGE COMPARTMENT LID DISARM SWITCH

Test Step	Result / Action to Take
NOTE: The luggage compartment key cylinder will not disarm the perimeter alarm system. Once armed, the perimeter alarm can only be disarmed using the remote keyless entry transmitter, driver door lock cylinder switch, the keyless entry keypad or a valid PATS key inserted into the ignition and turned to RUN.	
S1 RETRIEVE THE RECORDED DTCS FROM THE ON-DEMAND SELF-TEST REM	
• Use the recorded REM DTCs from the continuous and on-demand self-test. • **Are there any DTCs recorded?**	**Yes** If DTC B1984 GO to S2 . **No** GO to S3 .
S2 CHECK CIRCUIT 8 GL27 (WH/BU) FOR SHORT TO GROUND	
• Key in OFF position. • Disconnect: Luggage Compartment Switch C483. • Disconnect: REM C420b. • Measure the resistance between the luggage compartment lid disarm switch connector C483-2, circuit 8 GL27 (WH/BU) and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new luggage compartment lid disarm switch. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR circuit 8 GL27 (WH/BU). CLEAR the DTCs. REPEAT the self-test.
S3 CHECK CIRCUIT 31 GL27 (BK/OG)	
• Key in OFF position. • Disconnect: Luggage Compartment Disarm Switch C483. • Measure the resistance between the luggage compartment lid disarm switch connector C483-1, circuit 31 GL27 (BK/OG) and ground.	**Yes** GO to S4 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 A0040153 • **Is the resistance less than 5 ohms?**	
S4 CHECK CIRCUIT 8 GL27 (WH/BU) FOR OPEN	
• Disconnect: REM C420b. • Measure the resistance between REM connector C420b-15, circuit 8 GL27 (WH/BU) and luggage compartment lid disarm switch connector C483-2, circuit 8 GL27 (WH/BU).  A0040154 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new luggage compartment lid disarm switch. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

Key Programming Using Two Programmed Keys

Printable View (10 KB)

NOTE: This procedure only works if two or more programmed ignition keys are available and it is desired to program additional key(s). If two keys are not available, follow the procedure in Key Programming Using Diagnostic Equipment in this section.

NOTE: PID SPARE_KY must be enabled for this procedure to operate. If this PID is not enabled, follow the security access procedure, refer to Anti-Theft Security Access in this section and select SPARE KEY PROGRAMMING SWITCH: ENABLED.

NOTE: If the programming procedure is successful, the new key(s) will start the vehicle and the THEFT indicator will illuminate for approximately three seconds.

NOTE: If the programming procedure is not successful, the new key(s) will not start the vehicle and the THEFT indicator will flash. If the programming procedure was not successful, leave the ignition switch in the RUN position for at least 30 seconds then repeat the key programming procedure from Step 1. If the failure repeats, refer to Diagnosis and Testing to review the DTCs and carry out pinpoint tests as necessary.

NOTE: A maximum of eight ignition keys can be programmed to a passive anti-theft system (PATS) equipped vehicle. If more are needed, refer to Unlimited Key Mode Programming in this section.

NOTE: If the steps are not carried out as described, the programming procedure will end.

NOTE: Ignition keys must have correct mechanical key cut for the vehicle and must be the correct PATS encoded key for the vehicle.

NOTE: If the vehicle is in unlimited key mode, this spare programming procedure still functions. Any two keys that can start the vehicle may be used to program in an additional unlimited key.

1. Insert a programmed ignition key into the ignition lock cylinder and turn the ignition switch from OFF to RUN (maintain the ignition switch in RUN for three seconds but not longer than ten seconds).
2. Turn the ignition switch to OFF and remove the first key from the ignition lock cylinder.
3. Within ten seconds of turning the ignition switch to OFF, insert a second programmed ignition key into the ignition lock cylinder and turn the ignition switch from OFF to RUN (maintain the ignition switch in RUN for three seconds but not longer than ten seconds).
4. Turn the ignition switch to OFF and remove the second key from the ignition lock cylinder.
5. Within 20 seconds of turning the ignition lock cylinder to OFF, insert the unprogrammed ignition key (new key) into the ignition lock cylinder and turn the ignition switch from OFF to RUN (attempt to start the vehicle).
6. If it is desired to program additional key(s), repeat the key programming procedure from the beginning.

Key Programming Using Diagnostic Equipment

Printable View (16 KB)

Special Tool(s)

ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052, or equivalent diagnostic tool with appropriate adapter cable

NOTE: This procedure is used when a customer needs keys programmed into the system and does not have two programmed ignition keys available. This procedure is also useful when programmed ignition key(s) have been lost or a new ignition switch assembly as been installed, and it is desired to erase key(s) from the passive anti-theft system (PATS) memory.

NOTE: This procedure will erase all programmed ignition keys from the vehicle memory and the vehicle will not start until two keys have been reprogrammed to the vehicle.

NOTE: Two PATS encoded keys with the correct mechanical cut must be available to carry out this procedure. One or both of them may be the customer's original keys.

NOTE: If additional keys are to be programmed, refer to Key Programming Using Two Programmed Keys in this section. If the remaining keys are with the customer and are not available with the vehicle, then instruct the customer to refer to the Owner's Guide under the "Programming Spare (SecuriLock ® North America, Safeguard ® U.K. or PATS for all other markets) Keys Procedure" for instructions on programming the remaining keys.

1. Turn the ignition switch from OFF to RUN.
2. Using the diagnostic tool, follow the SECURITY ACCESS to obtain security access for the instrument cluster. For additional information, refer to Anti-Theft Security Access in this section.
3. From the diagnostic tool menu, select IGNITION KEY CODE ERASE.
4. Select RESET SERVICE BIT, if applicable.
5. **NOTE:** Do NOT select any additional commands from this menu.

   Turn the ignition switch to OFF and disconnect the diagnostic tool.
6. Insert the first encoded key into the ignition lock cylinder and turn the ignition switch to RUN for three seconds.
7. Insert the second encoded key into the ignition lock cylinder and turn the switch to the RUN position for three seconds.
8. Remove the second encoded key from the ignition lock cylinder.
9. The vehicle should now start with both ignition keys.

Key Programming Switch State Control Printable View (19 KB)

Special Tool(s)

ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052 or equivalent diagnostic tool with appropriate adapter cable

NOTE: The spare key programming switch is a diagnostic tool programmable switch which provides the capability to enable/disable the customer spare key programming procedure. This procedure is in the Owner's Literature spare key programming procedure and in this section under Key Programming Using Two Programmed Keys in this section. This programmable switch is provided as a convenience for customers who may not want the spare key programming procedure available to the vehicle driver.

NOTE: The spare key programming switch state can be viewed by instrument cluster PID SPARE_KY.

1. Insert a programmed ignition key into the ignition lock cylinder and turn the ignition switch to RUN.

2. Using the diagnostic tool select instrument cluster from the menu. Select SECURITY ACCESS to obtain security access. For additional information, refer to Anti-Theft Security Access in this section.

3. **NOTE:** The default setting on delivery of all new vehicles is <ENABLE>.

   From the diagnostic tool menu, select SPARE KEY PROGRAMMING SWITCH selection to desired setting:
   <ENABLE> Spare key programming procedure is accessible.
   <DISABLE> spare key programming procedure is not accessible.

Unlimited Key Mode Programming

Enabling Unlimited Key Mode

NOTE: Unlimited Key Mode is intended for use by those fleet customers who need more than eight keys for their vehicle.

4. The customer must choose a 8-digit, non-00,00,00,00 number that will be programmed to all of their vehicles. All customer vehicles need to use the same number. Valid digits are 0-9 plus the letters A-F.

5. Note: If the instrument cluster PID: UNLIMITED TRANSPONDER KEY ID is not displayed on screen, Unlimited Key Mode is turned on, and must be turned off before viewing the stored code. To view/change the stored code, follow the procedure for turning off Unlimited Key Mode below. Check the PID: UNLIMITED TRANSPONDER KEY ID and compare its value against the code chosen in Step 1.

6. Using the diagnostic tool, select instrument cluster from the menu. Follow SECURITY ACCESS to obtain security access. For additional information, refer to Anti-Theft Security Access in this section.

7. Turn OFF the unlimited key mode to view the security key PID.
8. If the Unlimited Transponder Security Key PID was 00,00,00,00, select Active Command: SET UNLIMITED TRANSPONDER KEY. Enter the 8-digit code chosen by the user.
9. Select: ENABLE UNLIMITED KEY MODE/RESET SERVICE BIT, if applicable.
10. Select: IGNITION CODE ERASE.
11. Disconnect the diagnostic tool and turn the ignition keys off.
12. Program in two ignition keys to enable the vehicle by cycling keys from OFF to RUN.
13. Program any additional keys using either Key Programming Using Two Programmed Keys or Key Programming Using Diagnostic Equipment in this section.

Disabling Unlimited Key Mode

1. Using a diagnostic tool, select instrument cluster from the menu. Follow SECURITY ACCESS to obtain security access. For additional information, refer to Anti-Theft Security Access in this section.
2. Select: DISABLE UNLIMITED KEY MODE.
3. Select: IGNITION KEY CODE ERASE and RESET SERVICE BIT, if applicable.
4. Disconnect the diagnostic tool and turn the ignition key to OFF.
5. Program in two keys to enable the vehicle.
6. Program any additional keys using either Key Programming Using Two Programmed Keys or Key Programming Using Diagnostic Equipment in this section.

Anti-Theft Security Access

Printable View (15 KB)

Special Tool(s)

ST2332-A	Worldwide Diagnostic System (WDS) 418-F224, New Generation STAR (NGS) Tester 418-F052 or equivalent diagnostic tool with appropriate adapter cable

NOTE: The security access procedure is utilized to obtain passive anti-theft system (PATS) security access. PATS security access must be granted to erase ignition keys, enable/disable unlimited key mode, and enable/disable the spare key programming switch (PID SPARE_KEY). The security access procedure invokes an inherent 10 minute time delay prior to granting security access during which the diagnostic tool must remain connected to the vehicle. Once security access has been granted, a security access command menu is displayed which offers various command options.

NOTE: Once security access has been granted, multiple security access commands should be executed (if necessary) prior to exiting the command menu. This avoids the carrying out of an additional security access procedure and the associated 10 minute time delay.

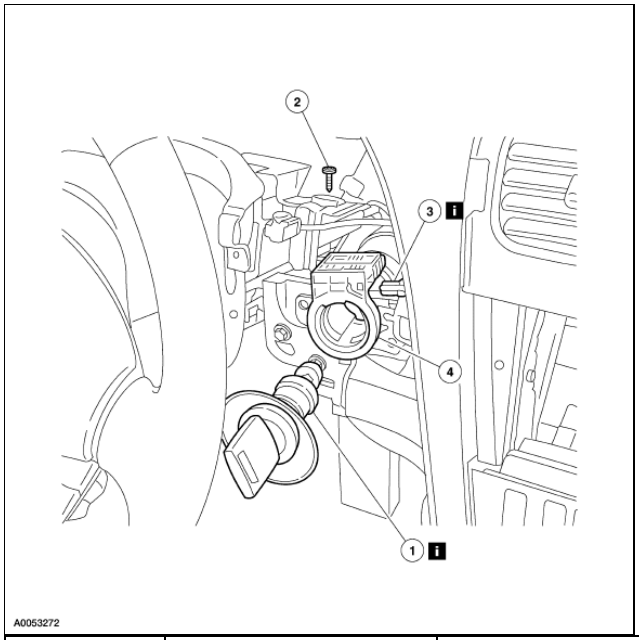
1. From the diagnostic tool select instrument cluster. Select SECURITY ACCESS. This procedure will take 10 minutes to carry out, during which the ignition switch must be in RUN and the diagnostic tool must be connected to the vehicle.

2. After the 10 minute security access procedure has been completed, a new menu will be displayed with command options. Select only those functions necessary before exiting out of this menu. Once exited out of this menu, the security access procedure must be repeated again to carry out additional commands.

Passive Anti-Theft System (PATS) Transceiver

Printable View (94 KB)

1. Disconnect the battery ground cable. For additional information, refer to Section 414-00 .
2. Remove the instrument cluster. For additional information, refer to Section 413-00 .
3. Remove the components in the order indicated in the illustration and table.



Item	Part Number	Description
1	1153	Ignition cylinder Removal Note
2		Screw
3	14401	Wiring harness connector Removal Note
4	15607	PATS transceiver

4. Install in the reverse order of removal.

Item 1: Ignition Cylinder Removal Note

1. Key in ON position.
2. Push the tab on the left side of the cylinder housing to release the cylinder.

Item 3: Wiring Harness Connector Removal Note

1. Position the transceiver ring toward the steering column to access the connector.

Universal Transmitter

Printable View (7 KB)

The HomeLink® universal transmitter is an integral part of the left hand sun visor assembly. This universal transmitter provides a convenient way to substitute up to three hand-held transmitters with a single built-in device. The transmitter will learn the radio frequency codes of most current transmitters to operate garage doors, entry gates, security systems, and home or office lighting.

Navigation System

Printable View (34 KB)

The vehicle navigation system audibly and visually guides the user to any entered destination. The system utilizes a global positioning system (GPS) antenna, a vehicle speed input and other sensor information to accurately establish the vehicle position. The navigation system module carries out all route calculations and sends the digital versatile disc (DVD) vector map information to the audio unit. The audio unit provides visual and audible instructions of the maneuvers required to arrive at the pre-entered destination.

Principles of Operation

Navigation System

The navigation system module controls the operation and the interface between the user, the vehicle subsystems, and the external components. The navigation system module is on the standard corporate protocol (SCP) network and can be diagnosed with a diagnostic tool. Communication through the controller area network (CAN) utilizes data transmitted and received between the navigation system module and the audio unit to control the video screen display through the video interface circuits.

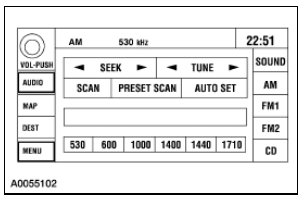
The vehicle navigation system will guide the user to a pre-entered destination. A map DVD stored in the navigation system module sends route calculation data to the audio unit. The audio unit will audibly and visually instruct the user of the maneuvers required to arrive at the destination entered.

A voice recognition system allows the user to interface with the system without using the touch screen. A microphone located in the rear view mirror provides a direct input to the navigation system module.

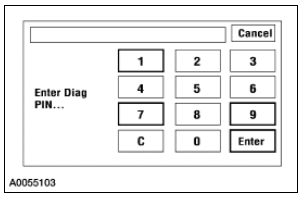
The navigation system module uses the GPS antenna, vehicle speed, and other internal sensor information to accurately establish vehicle position. In order to calculate the initial vehicle position, the GPS antenna is used to track several available satellites simultaneously. The GPS antenna only receives data and does not communicate with the satellites. A gyroscope integral to the navigation system module monitors the pitch and yaw of the vehicle created during cornering or turning. A hardwired vehicle speed input from the anti-lock brake system (ABS) module and a reverse input from the digital transmission range (TR) sensor through the SCP network are also used to detect vehicle speed and direction changes.

Diagnostics

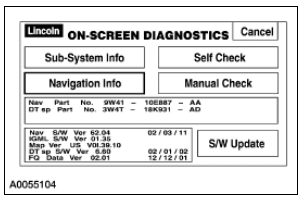
The navigation system provides internal self-diagnostics to assist with diagnosing vehicle concerns.



Press and hold the AUDIO and MENU buttons for 5 seconds.



Press 917 Enter.



- SELF CHECK provides internal self-test diagnostics. These DTCs are also accessible through the SCP network utilizing a diagnostic tool.
- NAVIGATION INFO provides access to speed signal, gyro, reverse input, and GPS information.
- SUB-SYSTEM INFO provides the various component configurations.
- MANUAL CHECK provides access to several diagnostics input tests:
    - Voice Output will verify the audio signals from the navigation system module and audio unit.
    - Hard Switch Test will check the various hardkey switches.
    - Microphone Test will check the strength of the voice signal.

Electronic Compass

Printable View (8 KB)

The compass display and module are an integral part of the rear view mirror. A two character display located in the upper right hand side of the mirror indicates the current direction of the vehicle (N, NE, E, SE, S, SW, W, NW). The compass continuously recalibrates due to changes in the magnetic field and will remain accurate during most driving conditions.

Principles of Operation

The compass is self-calibrating. This eliminates the need to manually set the compass. If the compass is displaying a heading and not displaying C or CAL, the compass is in auto-calibration mode. In this mode, the compass automatically calibrates for changes in vehicle magnetics over the life of the vehicle. This auto-calibration mode assures the compass heading is always accurate.

A display of C or CAL indicates the compass requires calibration. The compass may temporarily display C or CAL if the vehicle characteristics have changed (carwash, collision, etc.). Compass adjustment is controlled by the COMP switch which provides access to the calibration and zone adjustment procedures.

Excessive magnetism in or near the vehicle may cause the compass to display ALL SEGMENTS. In order to distinguish between vehicle magnetics and surrounding magnetics, drive the vehicle to an area that is free from large metal objects. Cycling the ignition switch ON and OFF will reset the compass. A display of ALL SEGMENTS within 20 seconds indicates excessive vehicle magnetism and the vehicle should be demagnetized. For additional information, refer to Vehicle Demagnetizing in this section.

Universal Transmitter Printable View (17 KB)

Refer to Wiring Diagrams Cell 89 , Courtesy Lamps for schematic and connector information.

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical
• Damaged universal transmitter • Damaged receiver

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and GO to Symptom Chart .

Symptom Chart

Symptom Chart
Pinpoint Test A: The Universal Transmitter Is Inoperative

Normal Operation

The HomeLink® universal transmitter is integral to the left sun visor assembly. Under normal operation the HomeLink® universal transmitter can be programmed to operate up to three garage doors, entry gates, security systems, and home or office lighting. Voltage is provided to the vanity mirror via circuit 29S-LB16 (OG/GN). Circuit 31-LB16 (BK) supplies the vanity mirror ground.

Possible Causes

- circuit 29S-LB16 (OG/GN) open or short to ground
- circuit 31-LB16 (BK) open
- receiver unit
- HomeLink® universal transmitter

PINPOINT TEST A: THE UNIVERSAL TRANSMITTER IS INOPERATIVE

Test Step	Result / Action to Take
A1 CHECK THE LEFT VANITY MIRROR OPERATION	
• Check the illumination of the left sun visor vanity mirror lamps. • **Do the vanity mirror lamps illuminate?**	**Yes** GO to A2 . **No** Section 417-02 .
A2 PROGRAM A HAND-HELD TRANSMITTER INTO A UNIVERSAL TRANSMITTER	
• **NOTE:** If the garage door is equipped with rolling codes, REFER to Universal Transmitter Programming in this section. • Program the universal transmitter; REFER to Universal Transmitter Programming in this section. • **Did the universal transmitter program successfully?**	**Yes** The universal transmitter is OK. VERIFY the receiver operates correctly. **No** INSTALL a new left sun visor assembly. TEST the system for normal operation.

Navigation System Printable View (477 KB)

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2332-A	Worldwide Diagnostic System (WDS) 418-F224 New Generation STAR (NGS) Tester 418-F052 or equivalent diagnostic tool with appropriate adapter cable

Inspection and Verification

1. Verify the customer concern
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Antenna coaxial cable • Global positioning system antenna • Navigation system DVD	• Battery junction box (BJB) fuse 14 (10A) • Central junction box (CJB) fuse(s): ♦ Fuse 2 (5A) ♦ Fuse 18 (20A) • Microphone • Circuitry • Navigation system module • Vehicle navigation radio

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before preceding to the next step.
4. If the cause is not visually evident, connect the diagnostic tool to the data link connector and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:

- check that the program card is correctly installed.
- check the connections to the vehicle.
- check the ignition switch position.

5. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

6. Carry out the data link diagnostics test. If the diagnostic tool responds with:

- SCP+, SCP- or UBP circuit fault; all electronic control units no response/not equipped, refer to Section 418-00 .
- No response/not equipped for the navigation system module, Go To Pinpoint Test B .
- System passed, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs and carry out self-test diagnostics for the navigation system module.

7. If the DTCs retrieved are related to the concern, go to the Navigation System Module Diagnostic Trouble Code (DTC) Index to continue diagnostics.

8. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

Navigation System Module Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1342	ECU is Defective	Navigation System Module	CLEAR the DTCs. REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new navigation system module. REFER to Navigation System Module in this section. CLEAR the DTCs. REPEAT the self-test.
B2139	Data Mismatch	Navigation System Module	CLEAR the DTCs. REPRAT the self-test. If DTC B2139 is retrieved again, REMOVE the navigation system module and send it to an authorized Ford audio system repair facility. REFER to Navigation System Module in this section. CLEAR the DTCs. REPEAT the self-test.
B2204	GPS Antenna Connection Open or Short	Navigation System Module	Go To Pinpoint Test C .
B2208	Navigation to Head Unit Communication Error	Navigation System Module	Go To Pinpoint Test J .
B2477	Module Configuration Failure	Navigation System Module	CHECK the navigation system module configuration. REFER to Section 418-00 .
B2633	Driver Front Microphone Circuit Failure	Navigation System Module	Go To Pinpoint Test K .
B2858	Head Unit is Defective	Navigation System Module	CLEAR the DTCs. REPEAT the self-test. If DTC B2858 is retrieved again, REMOVE the audio unit and send it to an authorized Ford audio system repair facility. REFER to Section 415-00 . CLEAR the DTCs. REPEAT the self-test.
C1192	Vehicle Speed Circuit Failure	Navigation System Module	Go To Pinpoint Test D .

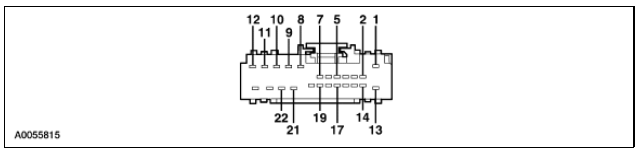
U1016	SCP Invalid Data (PCM)	Navigation System Module	Go To Pinpoint Test L .

For a complete list of navigation system module DTCs, refer to Section 418-00 .

Symptom Chart

Symptom Chart
Connector Circuit Reference

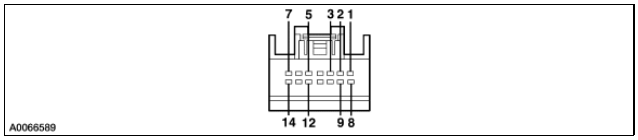
Navigation System Module C4209



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	30-GK8 (RD/BK) keep alive power feed	Greater than 10 volts with key ON or OFF.
2	10-GK8 (GY/BK) B+ voltage feed ON/ACC position	Greater than 10 volts with the key in ON or ACC.
5	4-GK8 (GY/BK) controller area network (CAN) (+) communication	Less than 5 ohms between the navigation system module and the audio unit with the audio unit disconnected. Greater than 10,000 ohms between the navigation system module and ground with the audio unit disconnected.
7	8-MC8 (WH/RD) navigation microphone (+)	Less than 5 ohms between the navigation system module and the rear view mirror with the rear view mirror disconnected. Greater than 10,000 ohms between the navigation system module and ground with the rear view mirror disconnected.
8	10-GK24 (GY/RD) video circuit RED	Less than 5 ohms between the navigation system module and the audio unit with the audio unit disconnected. Greater than 10,000 ohms between the navigation system module and ground with the audio unit disconnected.
9	10-GK26 (GY/VT) video circuit BLUE	Less than 5 ohms between the navigation system module and the audio unit with the audio unit disconnected. Greater than 10,000 ohms between the navigation system module and ground with the audio unit disconnected.
10	9-GK35 (BN) video return	Less than 5 ohms between the navigation system module and the audio unit with the audio unit disconnected. Greater than 10,000 ohms between the navigation system module and ground with the audio unit disconnected.
11	1-GK18 (WH/BU) navigation system voice (+)	Less than 5 ohms between the navigation system module and the audio unit with the audio unit disconnected. Greater than 10,000 ohms between the navigation system module and

		ground with the audio unit disconnected.
12	2-GK18 (GY/VT) navigation system voice (-)	Less than 5 ohms between the navigation system module and the audio unit with the audio unit disconnected. Greater than 10,000 ohms between the navigation system module and ground with the audio unit disconnected.
13	31-GK8 (BK/RD) navigation system module ground	Less than 5 ohms to ground.
14	8-CF63 (WH/GN) vehicle speed signal	Less than 5 ohms between the anti-lock brake system module and the navigation system module with the anti-lock brake system module disconnected. Greater than 10,000 ohms between the navigation system module and ground with the anti-lock brake system module disconnected.
17	5-GK8 (BU/YE) controller area network (CAN) (-) communication	Less than 5 ohms between the navigation system module and the audio unit with the audio unit disconnected. Greater than 10,000 ohms between the navigation system module and ground with the audio unit disconnected.
19	9-MC8 (BN/RD) navigation microphone (-)	Less than 5 ohms between the navigation system module and the rear view mirror with the rear view mirror disconnected. Greater than 10,000 ohms between the navigation system module and ground with the rear view mirror disconnected.
21	10-GK25 (GY/OG) video circuit GREEN	Less than 5 ohms between the navigation system module and the audio unit with the audio unit disconnected. Greater than 10,000 ohms between the navigation system module and ground with the audio unit disconnected.
22	8-GK35 (WH) video synchronization circuit	Less than 5 ohms between the navigation system module and the audio unit with the audio unit disconnected. Greater than 10,000 ohms between the navigation system module and ground with the audio unit disconnected.

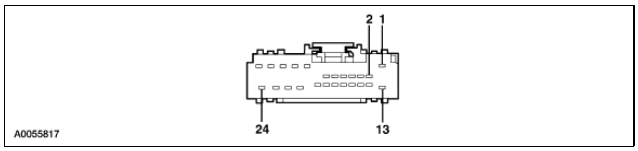
Audio Unit C2253c



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	10-GK24 (GY/RD) video circuit RED	Less than 5 ohms between the navigation system module and the audio unit with the navigation system module disconnected. Greater than 10,000 ohms between the audio unit and ground with the navigation system module disconnected.
2	10-GK25 (GY/OG) video circuit GREEN	Less than 5 ohms between the navigation system module and the audio unit with the navigation system module disconnected. Greater than 10,000 ohms between the audio unit and ground with the navigation system module disconnected.
3	9-GK35 (BN) video return	Less than 5 ohms between the navigation system module and the audio unit with the navigation system module

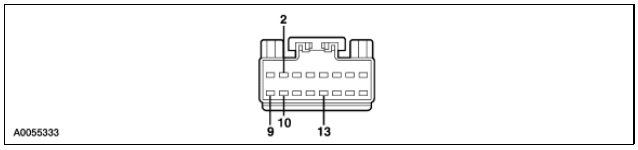
		disconnected. Greater than 10,000 ohms between the audio unit and ground with the navigation system module disconnected.
5	1-GK18 (WH/BU) navigation system voice (+)	Less than 5 ohms between the navigation system module and the audio unit with the navigation system module disconnected. Greater than 10,000 ohms between the audio unit and ground with the navigation system module disconnected.
7	4-GK8 (GY/BK) controller area network (CAN) (+) communication	Less than 5 ohms between the navigation system module and the audio unit with the navigation system module disconnected. Greater than 10,000 ohms between the audio unit and ground with the navigation system module disconnected.
8	10-GK26 (GY/VT) video circuit BLUE	Less than 5 ohms between the navigation system module and the audio unit with the navigation system module disconnected. Greater than 10,000 ohms between the audio unit and ground with the navigation system module disconnected.
9	8-GK35 (WH) video synchronization circuit	Less than 5 ohms between the navigation system module and the audio unit with the navigation system module disconnected. Greater than 10,000 ohms between the audio unit and ground with the navigation system module disconnected.
12	2-GK18 (GY/VT) navigation system voice (-)	Less than 5 ohms between the navigation system module and the audio unit with the navigation system module disconnected. Greater than 10,000 ohms between the audio unit and ground with the navigation system module disconnected.
14	5-GK8 (BU/YE) controller area network (CAN) (-) communication	Less than 5 ohms between the navigation system module and the audio unit with the navigation system module disconnected. Greater than 10,000 ohms between the audio unit and ground with the navigation system module disconnected.

Audio Unit C2253a



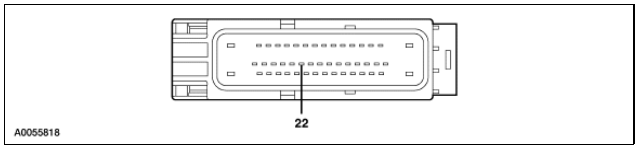
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	29-MD15 (OG/BK) keep alive power feed	Greater than 10.5 volts with key ON or OFF.
2	10-MD15 (GY/OG) B+ voltage feed in ON/ACC position	Greater than 10.5 volts with the key in ON or ACC.
13	31-MD15B (BK/GN) audio unit ground	Less than 5 ohms to ground.
24	31-MD15A (BK/GN) audio unit ground	Less than 5 ohms to ground.

Rear View Mirror C911



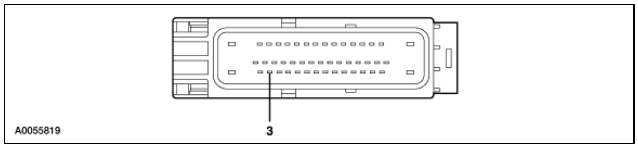
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
2	31-AD15 (BK/OG) rear view mirror ground	Less than 5 ohms to ground.
9	8-MC8 (WH/RD) rear view mirror microphone (+)	Less than 5 ohms between the navigation system module and the rear view mirror with the navigation system module disconnected. Greater than 10,000 ohms between the rear view mirror and ground with the navigation system module disconnected.
10	9-MC8 (BN/RD) rear view mirror microphone (-)	Less than 5 ohms between the navigation system module and the rear view mirror with the navigation system module disconnected. Greater than 10,000 ohms between the rear view mirror and ground with the navigation system module disconnected.
13	75-AD15 (YE/BU) switched B+ voltage feed	0 volts key OFF, greater than 10 volts key ON or ACC.

Anti-lock Brake System Module With Stability Assist C155



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
22	8-CF63 (WH/GN) vehicle speed signal	Less than 5 ohms between the anti-lock brake system module and the navigation system module with the navigation system module disconnected. Greater than 10,000 ohms between the anti-lock brake system module and ground with the navigation system module disconnected.

Anti-lock Brake System Module C155



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement

3	8-CF63 (WH/GN) vehicle speed signal	Less than 5 ohms between the anti-lock brake system module and the navigation system module with the navigation system module disconnected. Greater than 10,000 ohms between the anti-lock brake system module and ground with the navigation system module disconnected.

Pinpoint Test B: No Communication With The Navigation System Module

Normal Operation

Battery voltage is supplied to the navigation system module through circuit 30-GK8 (RD/BK). The driver door module (DDM) supplies voltage to the navigation system module through circuit 10-GK8 (GY/BK) in the ON/ACC position. Circuit 31-GK8 (BK/RD) provides the navigation system module ground.

Possible Causes

- circuit 30-GK8 (RD/BK) open or shorted to ground
- circuit 10-GK8 (GY/BK) open or shorted to ground
- circuit 31-GK8 (BK/RD) open
- navigation system module

PINPOINT TEST B: NO COMMUNICATION WITH THE NAVIGATION SYSTEM MODULE

Test Step	Result / Action to Take
B1 CHECK THE RECORDED DTCS FROM THE DRIVER DOOR MODULE	
• Use the recorded results from the driver door module self-test. • **Are any DTCs recorded?**	**Yes** If DTC 2359, refer to Section 418-00 to continue diagnosis of DTC B2359. **No** GO to B2 .
B2 CHECK CIRCUITS 30-GK8 (RD/BK) AND 10-GK8 (GY/BK) FOR VOLTAGE	
• Key in OFF position. • Disconnect: Navigation System Module C4209. • Key in ON position. • Measure the voltage between the navigation system module C4209-1, circuit 30-GK8 (RD/BK), harness side and ground; and between the navigation system module C4209-2, circuit 10-GK8 (GY/BK), harness side and ground.  	**Yes** GO to B3 . **No** REPAIR the circuit in question. TEST the system for normal operation.

• **Are the voltages greater than 10.5 volts?**	
B3 CHECK CIRCUIT 31-GK8 (BK/RD) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the navigation system module C4209-13, circuit 31-GK8 (BK/RD), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** REFER to Section 418-00 to continue communication diagnostics. **No** REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test C: Navigation System Does Not Operate Correctly The Global Positioning System (GPS) Antenna Signal Is Inoperative

Normal Operation

The GPS antenna provides information from the GPS satellite system to the GPS receiver in the navigation system module. This information is used to calculate vehicle position and direction of travel.

Possible Causes

- GPS antenna
- GPS antenna cable
- navigation system module

PINPOINT TEST C: NAVIGATION SYSTEM DOES NOT OPERATE CORRECTLY THE GLOBAL POSITIONING SYSTEM (GPS) ANTENNA SIGNAL IS INOPERATIVE

Test Step	Result / Action to Take
NOTE: The vehicle must be driven outside of any enclosed structure to an area that is unobstructed by trees, tall buildings, and bridges.	
C1 CHECK THE RECORDED DTCS FROM THE NAVIGATION SYSTEM MODULE	
• Use the recorded results from the navigation system module self-test. • **Are any DTCs recorded?**	**Yes** For DTC B2204, GO to C2 . **No** GO to C6 .
C2 CHECK THE GPS ANTENNA FOR AN OPEN	
• Key in OFF position. • Disconnect: GPS Antenna. • Measure the resistance between the GPS antenna center conductor pin, component side and the GPS antenna shield, component side.	**Yes** GO to C3 . **No** INSTALL a new GPS antenna. REFER to Global Positioning System (GPS) Antenna in this section. CLEAR the DTCs.

 A0056767 • **Is the resistance between 80 and 125 ohms?**	REPEAT the self-test.
C3 CHECK THE COAXIAL CABLE CENTER CONDUCTOR FOR A SHORT TO GROUND NAVIGATION SYSTEM MODULE DISCONNECTED	
• Disconnect: Navigation System Module GPS Antenna. • Measure the resistance between the navigation system module GPS antenna coaxial cable center conductor pin, harness side and ground.  A0056556 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C4 . **No** INSTALL a new antenna coaxial cable. CLEAR the DTCs. REPEAT the self-test.
C4 CHECK THE COAXIAL CABLE CENTER CONDUCTOR FOR AN OPEN	
• Measure the resistance between the GPS antenna coaxial cable center conductor pin, harness side and the navigation system module GPS antenna coaxial cable center conductor pin, harness side.  A0056557 • **Is the resistance less than 5 ohms?**	**Yes** GO to C5 . **No** INSTALL a new antenna coaxial cable. CLEAR the DTCs. REPEAT the self-test.
C5 CHECK THE COAXIAL CABLE SHIELD FOR AN OPEN	
• Measure the resistance between the GPS antenna coaxial cable shield, harness side and the navigation system module GPS antenna coaxial cable shield, harness side.  A0056558	**Yes** GO to C9 . **No** INSTALL a new antenna coaxial cable. CLEAR the DTCs. REPEAT the self-test.

• **Is the resistance less than 5 ohms?**	
C6 CHECK THE NAVIGATION SYSTEM	
• Move the vehicle outside of any enclosed structure to an area that is unobstructed by trees, tall buildings, and bridges. • Turn the audio unit on. • Press the MAP button.  A0065067  A0057837 • **Does the GPS icon disappear?**	**Yes** The system is operating correctly at this time. **No** GO to C7 .
C7 CHECK THE GPS SIGNAL STATUS	
• Press and hold the AUDIO and MENU buttons for 5 seconds.  A0055102 • Press 917 Enter.  A0055103 • Select Navigation Info.  A0055104 • Select GPS Information.	**Yes** The system is operating correctly at this time. **No** GO to C8 .

 A0055105 • Monitor the GPS status.  A0055106 • **After 10 minutes, does the ST (status) column of the GPS information display P (position) or T (tracking)?**	
C8 SUBSTITUTE THE GPS ANTENNA	
• Substitute a known good GPS antenna. • **After 10 minutes, does the ST (status) column of the GPS information display P (position) or T (tracking)?**	**Yes** INSTALL a new GPS antenna. Refer to Global Positioning System (GPS) Antenna in this section. CLEAR the DTCs. REPEAT the self-test. **No** REINSTALL the original antenna. GO to C9 .
C9 CHECK FOR CORRECT NAVIGATION SYSTEM MODULE OPERATION	

• Disconnect all navigation system module connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all navigation system module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new navigation system module. REFER to Navigation System Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test D: Navigation System Does Not Operate Correctly The Position Cursor Is Inoperative

Normal Operation

The anti-lock brake system (ABS) module supplies the vehicle speed signal (VSS) to the navigation system module through circuit 8-CF63 (WH/GN). The navigation system uses the VSS signal and the global positioning system (GPS) antenna to establish vehicle speed and position.

Possible Causes

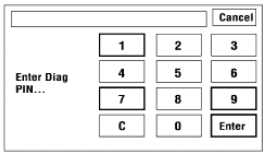
- circuit 8-CF63 (WH/GN) open or shorted to ground
- GPS antenna

- audio unit
- navigation system module
- anti-lock brake system (ABS) module

PINPOINT TEST D: NAVIGATION SYSTEM DOES NOT OPERATE CORRECTLY THE POSITION CURSOR IS INOPERATIVE

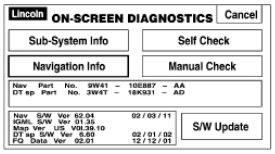
Test Step	Result / Action to Take
NOTE: Outdated map disc information may cause this symptom to recur at the same place.	
D1 CHECK THE RECORDED DTCS FROM THE NAVIGATION SYSTEM MODULE	
• Use the recorded results from the navigation system module self-test. • **Are any DTCs recorded?**	**Yes** For DTC C1192, GO to D2 . **No** GO to D4 .
D2 CHECK CIRCUIT 8-CF63 (WH/GN) FOR AN OPEN AND A SHORT TO GROUND	
• Key in OFF position. • Disconnect: Navigation System Module C4209. • Disconnect: Anti-lock Brake System Module. • For vehicles without stability assist, measure the resistance between the anti-lock brake system module C155-3, circuit 8-CF63 (WH/GN), harness side and the navigation system module C4209-14, circuit 8-CF63 (WH/GN), harness side; and between the navigation system module C4209-14, circuit 8-CF63 (WH/GN), harness side and ground.  • For vehicles with stability assist, measure the resistance between the anti-lock brake system module C155-22, circuit 8-CF63 (WH/GN), harness side and the navigation system module C4209-14, circuit 8-CF63 (WH/GN), harness side; and between the navigation system module C4209-14, circuit 8-CF63 (WH/GN), harness side and ground.  • **Is the resistance less than 5 ohms between the anti-lock brake system module and the navigation system module; and is the resistance greater than 10,000 ohms between the**	**Yes** GO to D3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

navigation system module and ground?	
D3 CHECK CIRCUIT 8-CF63 (WH/GN) FOR A SHORT TO VOLTAGE	
• Key in ON position. • Measure the voltage between the navigation system module C4209-14, circuit 8-CF63 (WH/GN), harness side and ground.  A0056565 • **Is any voltage indicated?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to D9 .
D4 CHECK THE NAVIGATION SYSTEM	
• Move the vehicle outside of any enclosed structure to an area that is unobstructed by trees, tall buildings, and bridges. • Turn the audio unit on. • Press the MAP button.  A0065067  A0057837 • **Does the GPS icon disappear?**	**Yes** GO to D5 . **No** Go To Pinpoint Test C .
D5 CHECK THE VEHICLE SPEED SIGNAL INPUT	
• Press and hold the AUDIO and MENU buttons for 5 seconds.  A0055102 • Press 917 Enter.	**Yes** GO to D7 . **No** If the speedometer is inoperative, REFER to Section 413-00 . If the speedometer is inaccurate, GO to D6 .



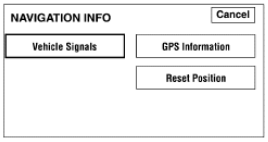
A0055103

- Select Navigation Info.

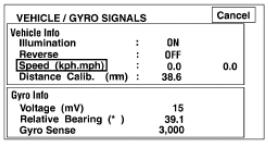


A0055104

- Select Vehicle Signals.



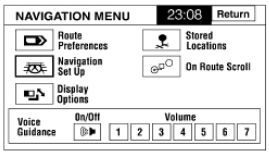
A0055107



A0055108

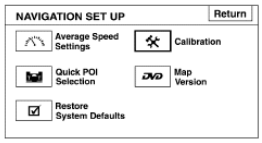
- Drive the vehicle at a minimum speed of 5 km/h (3 mph) per hour.
- **Does the SPEED signal correspond to the speed indicated on the vehicle speedometer?**

D6 CHECK THE VEHICLE SPEED SIGNAL CALIBRATION	
• Select Cancel to exit from diagnostic screens. • Press the MAP button.  A0065067 • Select Nav Menu.  A0057838 • Select Navigation Set Up.	**Yes** The system is operating correctly at this time. Concern may have been caused by a speed signal calibration error. **No** GO to D8 .



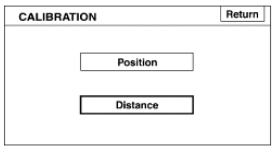
A0055110

- Select Calibration.



A0055111

- Select Distance.



A0055112

- Drive the vehicle a minimum of 10 km (6.25 miles).
- **Does the position cursor move along the course of the intended route?**

D7 CHECK THE GYROSCOPE SIGNAL	
• Monitor the gyro voltage.  A0055113 • Drive the vehicle turning left and right. • **Does the gyro voltage change when the vehicle turns left or right?**	**Yes** GO to D8 . **No** The gyroscope is integral to the navigation system module. INSTALL a new navigation system module. REFER to Navigation System Module in this section. TEST the system for normal operation.
D8 CHECK FOR CORRECT NAVIGATION SYSTEM MODULE OPERATION	

• Disconnect all navigation system module connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all navigation system module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new navigation system module. REFER to Navigation System Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector.

	CLEAR the DTCs. REPEAT the self-test.
D9 CHECK FOR CORRECT ANTI-LOCK BRAKE SYSTEM MODULE OPERATION	

• Disconnect all anti-lock brake module connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all anti-lock brake module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new anti-lock brake system module. REFER to Section 206-09 .
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test E: Navigation System Does Not Operate Correctly The Voice Guidance Is Inoperative/Does Not Operate Correctly

Normal Operation

The navigation system module provides voice-assisted route guidance to the audio unit through the audio circuits 1-GK18 (WH/BU) and 2-GK18 (GY/VT). The volume of the voice guidance is controlled by the audio unit.

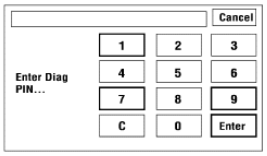
Possible Causes

- circuit 1-GK18 (WH/BU) open or shorted
- circuit 2-GK18 (GY/VT) open or shorted
- navigation system module
- audio unit

PINPOINT TEST E: NAVIGATION SYSTEM DOES NOT OPERATE CORRECTLY THE VOICE GUIDANCE IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

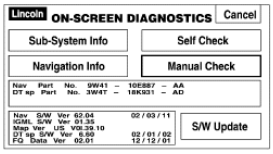
Test Step	Result / Action to Take
E1 CHECK THE SPEAKERS	
• Key in ON position. • Turn the audio unit on. • Carry out the speaker walk-around test by pressing the MAP and DEST buttons on the audio unit while in the AM or FM mode for five seconds. • **Do the speakers operate correctly?**	**Yes** GO to E2 . **No** REFER to Section 415-00 to continue audio system diagnostics.
E2 CALCULATE A VEHICLE ROUTE	
• Calculate a vehicle route by setting a desired destination. • Press the voice icon on the present position screen.	**Yes** The system is operating correctly at this time. **No** GO to E3 .

 A0057839 • **Does the voice guidance system operate correctly?**	
E3 CHECK THE VOICE GUIDANCE	
• Select Nav Menu.  A0057838 • Select Voice Guidance.  A0055114 • **Is the voice guidance system on the navigation menu turned ON?**	**Yes** GO to E4 . **No** Turn the voice guidance system ON. TEST the system for normal operation.
E4 CHECK THE VOICE GUIDANCE VOLUME	
• Select Volume.  A0055115 • **Is the volume adjustment set to minimum?**	**Yes** Increase the sound volume. Test the system for normal operation. **No** GO to E5 .
E5 CHECK THE AUDIO UNIT OUTPUT	
• Press and hold the AUDIO and MENU buttons for 5 seconds.  A0055102 • Press 917 Enter.	**Yes** GO to E6 . **No** REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. REFER to Section 415-00 . TEST the system for normal operation.



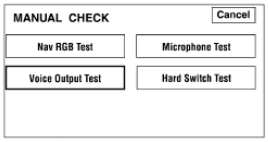
A0055103

- Select Manual Check.



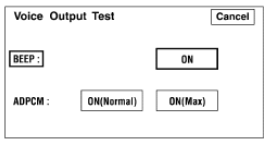
A0055116

- Select Voice Output Test.



A0055117

- Select BEEP On.



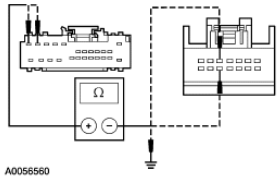
A0055118

- **Was a tone emitted by the audio unit?**

E6 CHECK THE NAVIGATION SYSTEM MODULE OUTPUT	
• Select ADPCM ON (Normal).  A0055119 • **Was a tone emitted by the navigation system module?**	**Yes** GO to E9 . **No** GO to E7 .
E7 CHECK CIRCUITS 1-GK18 (WH/BU) AND 2-GK18 (GY/VT) FOR AN OPEN AND A SHORT TO GROUND	
• Key in OFF position. • Disconnect: Audio Unit C2253c. • Disconnect: Navigation System Module C4209. • Measure the resistances between the navigation system module C4209 pins harness side and the audio unit C2253c pins harness side; and between the navigation system module C4209 pins harness side and ground as	**Yes** GO to E8 . **No** REPAIR the circuit in question. TEST the system for normal operation.

follows:

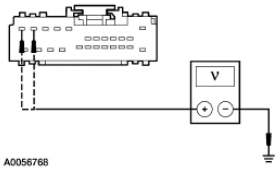
Navigation System Module Pin	Audio Unit Pin	Circuit
C4209-11	C2253c-5	1-GK18 (WH/BU)
C4209-12	C2253c-12	2-GK18 (GY/VT)



- **Are the resistances less than 5 ohms between the navigation system module and the audio unit; and are the resistances greater than 10,000 ohms between the navigation system module and ground?**

E8 CHECK CIRCUITS 1-GK18 (WH/BU) AND 2-GK18 (GY/VT) FOR A SHORT TO VOLTAGE

- Key in ON position.



- Measure the voltage between the navigation system module C4209-11, circuit 1-GK18 (WH/BU), harness side and ground; and between the navigation system module C4209-12, circuit 2-GK18 (GY/VT), harness side and ground.
- **Is any voltage indicated?**

Yes
REPAIR the circuit in question. TEST the system for normal operation.

No
GO to E9 .

E9 CHECK FOR CORRECT NAVIGATION SYSTEM MODULE OPERATION

- Disconnect all navigation system module connectors.
- Check for:
  - corrosion
  - pushed-out pins
- Connect all navigation system module connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

Yes
INSTALL a new navigation system module. REFER to Navigation System Module in this section. TEST the system for normal operation.

No
The system is operating correctly at this time. Concern may have been caused by a loose or corroded

	connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test F: Navigation System Does Not Operate Correctly The Display Screen Is Inoperative

Normal Operation

The audio unit display is controlled by the navigation system module. Video color is provided through circuits 10-GK24 (GY/RD), 10-GK25 (GY/OG), and 10-GK26 (GY/VT). Circuit 8-GK35 (WH) provides the color synchronization and circuit 9-GK35 (BN) is the video signal return.

Possible Causes

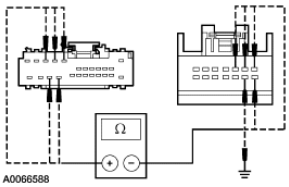
- circuit 10-GK24 (GY/RD) open or shorted
- circuit 10-GK25 (GY/OG) open or shorted
- circuit 10-GK26 (GY/VT) open or shorted
- circuit 8-GK35 (WH) open or shorted
- circuit 9-GK35 (BN) open or shorted
- navigation system module
- audio unit

PINPOINT TEST F: NAVIGATION SYSTEM DOES NOT OPERATE CORRECTLY THE DISPLAY SCREEN IS INOPERATIVE

Test Step	Result / Action to Take
F1 CHECK THE RECORDED DTCS FROM THE NAVIGATION SYSTEM MODULE	
• Use the recorded results from the navigation system module self-test. • **Are any DTCs recorded?**	**Yes** For DTC B2208, Go To Pinpoint Test J to diagnose the audio unit. For all other DTCs, REFER to the Navigaton System Module Diagnostic Trouble Code (DTC) Index in this section. **No** GO to F2 .
F2 CHECK THE AUDIO UNIT BUTTONS	
• Press the MAP, AUDIO, DEST, and MENU buttons.  A0065066 • **Does the display screen operate correctly?**	**Yes** The system is operating correctly at this time. Concern may have been caused by SCREEN OFF selection on MENU screen. **No** GO to F3 .
F3 CHECK VIDEO AND SYNCHRONIZATION CIRCUITS FOR AN OPEN AND A SHORT TO GROUND	

- Key in OFF position.
- Disconnect: Audio Unit C2253a.
- Disconnect: Navigation System Module C4209.
- Measure the resistances between the navigation system module C4209 pins harness side and the audio unit C2253a pins harness side; and between the navigation system module C4209 pins harness side and ground as follows:

Navigation System Module Pin	Audio Unit Pin	Circuit
C4209-8	C2253c-1	10-GK24 (GY/RD)
C4209-9	C2253c-8	10-GK26 (GY/VT)
C4209-10	C2253c-3	9-GK35 (BN)
C4209-21	C2253c-2	10-GK25 (GY/OG)
C4209-22	C2253c-9	8-GK35 (WH)



- **Are the resistances less than 5 ohms between the navigation system module and the audio unit; and are the resistances greater than 10,000 ohms between the navigation system module and ground?**

Yes
GO to F4 .

No
REPAIR the circuit in question. TEST the system for normal operation.

F4 CHECK VIDEO AND SYNCHRONIZATION CIRCUITS FOR A SHORT TO VOLTAGE

- Key in ON position.
- Measure the voltage between the navigation system module C4209 pins harness side and ground as follows:

Navigation System Module Pin	Circuit
C4209-8	10-GK24 (GY/RD)
C4209-9	10-GK26 (GY/VT)
C4209-10	9-GK35 (BN)
C4209-21	10-GK25 (GY/OG)
C4209-22	8-GK35 (WH)

Yes
REPAIR the circuit the question. TEST the system for normal operation.

No
GO to F5 .

 • **Is any voltage indicated?**	
F5 SUBSTITUTE THE AUDIO UNIT	
• Substitute a known good audio unit. • **Does the screen display appear?**	**Yes** REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. REFER to Section 415-00 . TEST the system for normal operation. **No** REINSTALL the original audio unit.GO to F6 .
F6 CHECK FOR CORRECT NAVIGATION SYSTEM MODULE OPERATION	

• Disconnect all navigation system module connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all navigation system module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new navigation system module. REFER to Navigation System Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test G: Navigation System Does Not Operate Correctly The Navigation Screen Is Inoperative

Normal Operation

The screen display of the audio unit for audio and navigation is controlled by the navigation system module. A map digital versatile disc (DVD) stored in the navigation system module sends route data to the audio unit through the video interface circuits.

Possible Causes

- navigation system disc
- navigation system module
- audio unit

PINPOINT TEST G: NAVIGATION SYSTEM DOES NOT OPERATE CORRECTLY THE NAVIGATION SCREEN IS INOPERATIVE

Test Step	Result / Action to Take
G1 CHECK THE SWITCH DISPLAY	
• Key in ON position. • Turn the audio unit on. • Press and hold the AUDIO and MENU buttons for 5 seconds.  A0055102 • Press 917 Enter.  A0055103 • Select Manual Check.  A0055116 • Select Hard Switch Test.  A0055120 • Push each switch on the display.  A0055121 • **Are all of the switches operating correctly?**	**Yes** GO to G2 . **No** REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. REFER to Section 415-00 . TEST the system for normal operation.
G2 CHECK MAP DISC SURFACE	

• Key in OFF position. • Key in ON position. • Visually inspect the map disc surface. • **Is the map disc dirty or scratched?**	**Yes** INSTALL a new map disc. TEST the system for normal operation. **No** REINSTALL the map disc. GO to G3 .
G3 CHECK THE MAP DISPLAY	
• Key in OFF position. • Key in ON position. • Press the MAP button.  A0065067 • **Is the map displayed?**	**Yes** The system is operating correctly at this time. **No** GO to G4 .
G4 CHECK FOR CORRECT NAVIGATION SYSTEM MODULE OPERATION	

• Disconnect all navigation system module connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all navigation system module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new navigation system module. REFER to Navigation System Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test H: Navigation System Does Not Operate Correctly The Audible Switches Are Inoperative

Normal Operation

The audible switch feedback settings are controlled by the audio unit. The notification can be set to all, touch screen, and none depending on user preference.

Possible Causes

- audio unit

PINPOINT TEST H: NAVIGATION SYSTEM DOES NOT OPERATE CORRECTLY THE AUDIBLE SWITCHES ARE INOPERATIVE

Test Step	Result / Action to Take
H1 CHECK THE SWITCH DISPLAY	

• Key in ON position. • Turn the audio unit on. • Press the MENU button.  A0066586 • Select SYSTEM SETUP.  A0055122 • Select AUDIBLE FEEDBACK.  A0055123 • **Is NONE highlighted on the audible feedback settings?**	**Yes** Select ALL. TEST the system for normal operation. **No** REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. REFER to Section 415-00 . TEST the system for normal operation.

Pinpoint Test I: Navigation System Does Not Operate Correctly Unable to Insert or Eject Map Disc

Normal Operation

The navigation map disc is contained in the navigation system module. The voltage is supplied to the navigation system module with the key in the ON or ACC position through 10-GK8 (GY/BK). Circuit 31-GK8 (BK/RD) supplies the navigation system module ground.

Possible Causes

- circuit 10-GK8 (GY/BK) open or shorted
- circuit 31-GK8 (BK/RD) open
- navigation system module

PINPOINT TEST I: NAVIGATION SYSTEM DOES NOT OPERATE CORRECTLY UNABLE TO INSERT OR EJECT MAP DISC

Test Step	Result / Action to Take
I1 CHECK CIRCUIT 10-GK8 (GY/BK) FOR VOLTAGE	

• Key in OFF position. • Disconnect: Navigation System Module C4209. • Key in ON position. • Measure the voltage between the navigation system module C4209-2, circuit 10-GK8 (GY/BK), harness side and ground.  A0056574 • **Is the voltage greater than 10 volts?**	**Yes** GO to I2 . **No** REPAIR the circuit. TEST the system for normal operation.
I2 CHECK CIRCUIT 31-GK8 (BK/RD) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the navigation system module C4209-13, circuit 31-GK8 (BK/RD), harness side and ground.  A0056554 • **Is the resistance less than 5 ohms?**	**Yes** GO to I3 . **No** REPAIR the circuit. TEST the system for normal operation.
I3 CHECK FOR CORRECT NAVIGATION SYSTEM MODULE OPERATION	

• Disconnect all navigation system module connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all navigation system module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new navigation system module. REFER to Navigation System Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test J: Navigation System Does Not Operate Correctly The Audio Unit Is Inoperative

Normal Operation

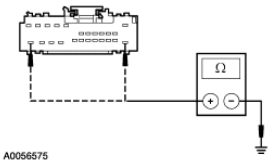
The navigation system module communicates to the audio unit through circuits 5-GK8 (BU/YE) and 4-GK8 (GY/BK) using the controller area network (CAN) protocol. Battery voltage is supplied to the audio unit through circuit 29-MD15 (OG/BK). Circuit 10-MD15 (GY/OG) provides voltage to the audio unit with the key in the ON or ACC position. The audio unit ground is supplied through circuits 31-MD15B (BK/GN) and 31-MD15A (BK/GN).

Possible Causes

- circuit 4-GK8 (GY/BK) open or shorted
- circuit 5-GK8 (BU/YE) open or shorted
- circuit 29-MD15 (OG/BK) open or shorted to ground
- circuit 10-MD15 (GY/OG) open or shorted to ground
- circuit 31-MD15A (BK/GN) open
- circuit 31-MD15B (BK/GN) open
- navigation system module
- audio unit

PINPOINT TEST J: NAVIGATION SYSTEM DOES NOT OPERATE CORRECTLY THE AUDIO UNIT IS INOPERATIVE

Test Step	Result / Action to Take
J1 CHECK THE RECORDED DTCS FROM THE NAVIGATION SYSTEM MODULE	
• Use the recorded results from the navigation system module self-test. • **Are any DTCs recorded?**	**Yes** For DTC B2208, GO to J2 . **No** Go To Pinpoint Test F to diagnose the video circuits.
J2 CHECK CIRCUITS 29-MD15 (OG/BK) AND 10-MD15 (GY/OG) FOR VOLTAGE	
• Key in OFF position. • Disconnect: Audio Unit C2253c. • Key in ON position. • Measure the voltage between the audio unit C2253a-1, circuit 29-MD15 (OG/BK), harness side and ground; and between the audio unit C2253c-2, circuit 10-MD15 (GY/OG), harness side and ground.  • **Are the voltages greater than 10 volts?**	**Yes** GO to J3 . **No** REPAIR the circuit in question. CLEAR the DTCs. TEST the system for normal operation.
J3 CHECK CIRCUITS 31-MD15B (BK/GN) AND 31-MD15A (BK/GN) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the audio unit C2253a-13, circuit 31-MD15B (BK/GN), harness side and ground; and between the audio unit C2253c-24, circuit 31-MD15A (BK/GN), harness side and ground.	**Yes** GO to J4 . **No** REPAIR the circuit in question. CLEAR the DTCs. TEST the system for normal operation.

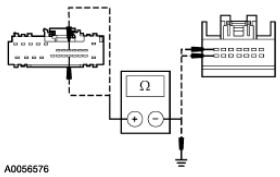


- **Are the resistances less than 5 ohms?**

J4 CHECK CIRCUITS 5-GK8 (BU/YE) AND 4-GK8 (GY/BK) FOR AN OPEN AND A SHORT TO GROUND

- Disconnect: Navigation System Module C4209.
- Disconnect: Audio Unit C2253a.
- Measure the resistances between the navigation system module C4209 pins harness side and audio unit C2253a pins harness side; and between the navigation system module C4209 pins harness side and ground as follows:

Navigation System Module Pin	Audio Unit Pin	Circuit
C4209-5	C2253c-7	4-GK8 (GY/BK)
C4209-17	C2253c-14	5-GK8 (BU/YE)



- **Are the resistances less than 5 ohms between the navigation system module and the audio unit; and are the resistances greater than 10,000 ohms between the navigation system module and ground?**

Yes
GO to J5 .

No
REPAIR the circuit in question. CLEAR the DTCs. TEST the system for normal operation.

J5 CHECK CIRCUITS 5-GK8 (BU/YE) AND 4-GK8 (GY/BK) FOR A SHORT TO VOLTAGE

- Key in ON position.
- Measure the voltage between the navigation system module C4209-5, circuit 4-GK8 (GY/BK), harness side and ground; and between the navigation system module C4209-17, circuit 5-GK8 (BU/YE), harness side and ground.

Yes
REPAIR the circuit in question. CLEAR the DTCs. TEST the system for normal operation.

No
GO to J6 .

 • **Is any voltage indicated?**	
J6 SUBSTITUTE THE AUDIO UNIT	
• Substitute a known good audio unit. • Repeat the navigation system module self-test. • **Is DTC B2208 present?**	**Yes** REINSTALL the original audio unit. GO to J7 . **No** REMOVE the audio unit and SEND it to an authorized Ford audio system repair facility. REFER to Section 415-00 . CLEAR the DTCs. TEST the system for normal operation.
J7 CHECK FOR CORRECT NAVIGATION SYSTEM MODULE OPERATION	

• Disconnect all navigation system module connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all navigation system module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new navigation system module. REFER to Navigation System Module in this section. TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test K: DTC B2633 Driver Front Microphone Circuit Failure

Normal Operation

The navigation system microphone is integrated into the rear view mirror. The microphone supplies a voice signal to the navigation system module through circuits 8-MC8 (WH/RD) and 9-MC8 (BN/RD). The rear view mirror receives switched B+ voltage through circuit 75-AD15 (YE/BU). Circuit 31-AD15 (BK) provides the mirror ground.

Possible Causes

- circuit 8-MC8 (WH/RD) open or shorted
- circuit 9-MC8 (BN/RD) open or shorted
- circuit 75-AD15 (YE/BU) open or shorted to ground
- circuit 31-AD15 (BK) open
- microphone
- navigation system module

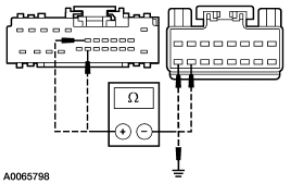
PINPOINT TEST K: DTC B2633 DRIVER FRONT MICROPHONE CIRCUIT FAILURE

Test Step	Result / Action to Take
K1 CHECK VOICE SIGNAL FROM THE MICROPHONE	
• Key in OFF position. • Disconnect: Navigation System Module C4209. • Key in ON position. • Measure the voltage between the navigation system module C4209-7, circuit 8-MC8 (WH/RD) , harness side and between the navigation system module C4209-19, 9-MC8 (BN/RD), harness side while speaking loudly into the rear view mirror microphone.  A0056578 • **Is any AC voltage indicated?**	**Yes** GO to K6 . **No** GO to K2 .
K2 CHECK CIRCUIT 75-AD15 (YE/BU) FOR VOLTAGE	
• Key in OFF position. • Disconnect: Rear View Mirror C911. • Key in ON position. • Measure the voltage between the rear view mirror C911-13, circuit 75-AD15 (YE/BU), harness side and ground.  A0056581 • **Is the voltage greater than 10 volts?**	**Yes** GO to K3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
K3 CHECK CIRCUIT 31-AD15 (BK) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the rear view mirror C911-2, circuit 31-AD15 (BK/OG), harness side and ground.  A0056582 • **Is the resistance less than 5 ohms?**	**Yes** GO to K4 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
K4 CHECK CIRCUITS 8-MC8 (WH/RD) AND 9-MC8 (BN/RD) FOR AN OPEN AND A SHORT TO GROUND	

<table>
<tr><td>

- Measure the resistances between the navigation system module C4209 pins harness side and the rear view mirror C911 pins harness side; and between the navigation system module C4209 pins harness side and ground as follows:

Navigation System Module Pin	Rear View Mirror Pin	Circuit
C4209-7	C911-9,	8-MC8 (WH/RD)
C4209-19	C911-10	9-MC8 (BN/RD)



- **Are the resistances less than 5 ohms between the navigation system module and the rear view mirror; and are the resistances greater than 10,000 ohms between the navigation system module and ground?**

</td><td>

Yes
GO to K5 .

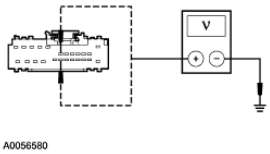
No
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

</td></tr>
<tr><td>

K5 CHECK CIRCUITS 8-MC8 (WH/RD) AND 9-MC8 (BN/RD) FOR A SHORT TO VOLTAGE

</td><td></td></tr>
<tr><td>

- Key in ON position.
- Measure the voltage between the navigation system module C4209-7, circuit 8-MC8 (WH/RD) , harness side and ground; and between the navigation system module C4209-19, 9-MC8 (BN/RD), harness side and ground.



- **Is any voltage indicated?**

</td><td>

Yes
REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

No
INSTALL a new rear view mirror. REFER to Section 501-00 . CLEAR the DTCs. REPEAT the self-test.

</td></tr>
<tr><td>

K6 CHECK FOR CORRECT NAVIGATION SYSTEM MODULE OPERATION

</td><td></td></tr>
<tr><td>

- Disconnect all navigation system module connectors.
- Check for:
  - corrosion
  - pushed-out pins
- Connect all navigation system module connectors and make sure they seat correctly.
- Operate the system and verify the concern is still present.
- **Is the concern still present?**

</td><td>

Yes
INSTALL a new navigation system module. REFER to Navigation System Module in this section. TEST the system for normal operation.

No
The system is operating correctly

</td></tr>
</table>

	at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test L: DTC U1016 SCP Invalid Data Powertrain Control Module

Normal Operation

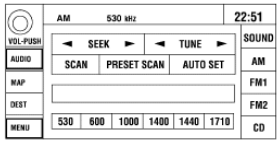
The navigation system module receives a vehicle in reverse signal from the powertrain control module (PCM) through the standard corporate protocol (SCP) network.

Possible Causes

- PCM

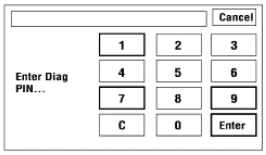
PINPOINT TEST L: DTC U1016 SCP INVALID DATA POWERTRAIN CONTROL MODULE

Test Step	Result / Action to Take
L1 CHECK THE RECORDED DTCS FROM THE POWERTRAIN CONTROL MODULE (PCM)	
• Use the recorded results from the PCM self-test. • **Are any DTCs recorded?**	**Yes** For PXXX codes, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. For all other codes, REFER to Section 418-00 . **No** GO to L2 .
L2 MONITOR THE PCM REVERSE INPUT	
• Enter the following diagnostic mode on the diagnostic tool: PCM PID Monitor. • Monitor the transmission range (TR) sensor PID. • Place the selector lever in REVERSE. • **Does the TR sensor PID indicate correctly?**	**Yes** GO to L3 . **No** REFER to Section 307-01 to continue diagnosis of the input.
L3 CHECK THE REVERSE SIGNAL INPUT	
• Press and hold the AUDIO and MENU buttons for 5 seconds.	**Yes** CLEAR the DTCs. REPEAT the self-test. IF DTC U1016 is retrieved again, GO to L4 . **No** GO to L4 .



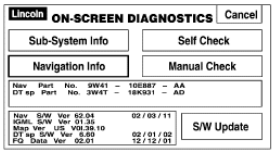
A0055102

- Press 917 Enter.



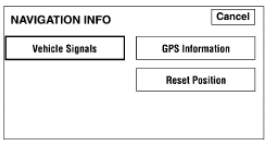
A0055103

- Select Navigation Info.

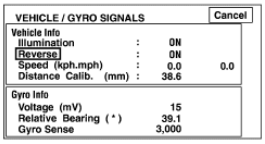


A0055104

- Select Vehicle Signals.



A0055107



A0068110

- **Does the reverse signal indicate ON?**

L4 CHECK FOR CORRECT NAVIGATION SYSTEM MODULE OPERATION	

• Disconnect all navigation system module connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all navigation system module connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new navigation system module. REFER to Navigation System Module in this section. CLEAR the DTCs. REPEAT the self-test.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Electronic Compass

Printable View (51 KB)

Refer to Wiring Diagrams Cell 125 for schematic and connector information.

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent

Inspection and Verification

1. Verify the customer concern by operating the vehicle along roads of known direction to duplicate the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

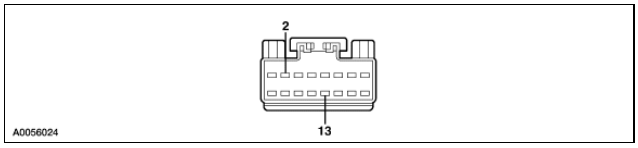
Mechanical	Electrical
• Mirror assembly	• Central junction box (CJB) fuse 12 (5A) • Microphone • Circuitry • Compass sensor (integral to the rear view mirror)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the cause is not visually evident, verify the symptom and GO to Symptom Chart .

Symptom Chart

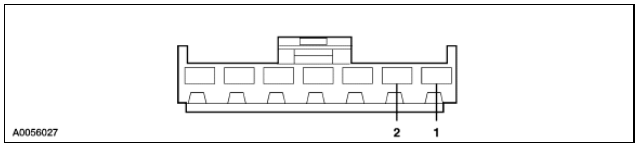
Symptom Chart
Connector Circuit Reference

Rear View Mirror C911



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
2	Circuit 31-AD15 (BK/OG) ground	0 voltage, less than 5 ohms to ground.
13	Circuit 75-AD15 (YE/BU) switched B+ voltage feed	Greater than 10 volts with key ON or ACC.

Electrochromatic Rear View Mirror C9012



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	Circuit 75-AD15 (YE/BU) switched B+ voltage feed	Greater than 10 volts with key ON or ACC.
2	Circuit 31-AD15 (BK/OG) ground	0 voltage, less than 5 ohms to ground.

Pinpoint Test M: The Compass Is Inoperative

Normal Operation

The compass display and module are integrated into the rear view mirror. The rear view mirror receives switched B+ voltage via circuit 75-AD15 (YE/BU). Circuit 31-AD15 (BK/OG) provides the mirror ground.

Possible Causes

- circuit 75-AD15 (YE/BU) open or shorted to ground
- circuit 31-AD15 (BK/OG) open
- rear view mirror

PINPOINT TEST M: THE COMPASS IS INOPERATIVE

Test Step	Result / Action to Take
M1 CHECK THE VEHICLE OPTIONS	
• Check the vehicle options. • **Is the vehicle equipped with navigation?**	**Yes** GO to M2 . **No** GO to M4 .

M2 CHECK CIRCUIT 75-AD15 (YE/BU) FOR VOLTAGE	
• Key in OFF position. • Disconnect: Rear View Mirror C911. • Key in ON position. • Measure the voltage between the rear view mirror C911-13, circuit 75-AD15 (YE/BU), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to M3 . **No** REPAIR the circuit. Test the system for normal operation.
M3 CHECK CIRCUIT 31-AD15 (BK) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the rear view mirror C911-2, circuit 31-AD15 (BK/OG), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new rear view mirror. REFER to Section 501-00 . TEST the system for normal operation. **No** REPAIR the circuit. Test the system for normal operation.
M4 CHECK CIRCUIT 75-AD15 (YE/BU) FOR VOLTAGE ELECTROCHROMATIC REAR VIEW MIRROR	
• Key in OFF position. • Disconnect: Rear View Mirror C9012. • Key in ON position. • Measure the voltage between the rear view mirror C9012-1, circuit 75-AD15 (YE/BU), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to M5 . **No** REPAIR the circuit. Test the system for normal operation.
M5 CHECK CIRCUIT 31-AD15 (BK) FOR AN OPEN ELECTROCHROMATIC REAR VIEW MIRROR	

• Key in OFF position. • Measure the resistance between the rear view mirror C9012-2, circuit 31-AD15 (BK/OG), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new rear view mirror. REFER to Section 501-00 . TEST the system for normal operation. **No** REPAIR the circuit. Test the system for normal operation.

Pinpoint Test N: The Compass Is Inaccurate

Normal Operation

The compass display and module are integrated into the rear view mirror. The compass adjustment and zone variation are controlled by the COMP switch on the mirror.

Possible Causes

- compass zone setting
- compass zone adjustment
- rear view mirror

PINPOINT TEST N: THE COMPASS IS INACCURATE

Test Step	Result / Action to Take
N1 CHECK THE COMPASS ZONE ADJUSTMENT	
• Carry out the compass zone adjustment procedure. REFER to Compass Zone Adjustment in this section. • **Is the compass zone set correctly?**	**Yes** GO to N2 . **No** INSTALL a new rear view mirror. REFER to Section 501-00 . TEST the system for normal operation.
N2 CALIBRATE THE COMPASS	
• Carry out the compass calibration adjustment procedure. REFER to Compass Calibration in this section. • **Does the compass calibrate correctly?**	**Yes** GO to N4 . **No** GO to N3 .
N3 DEMAGNETIZE THE VEHICLE	
• Demagnetize the vehicle. REFER to Vehicle Demagnetizing in this section. • **Does the compass calibrate correctly?**	**Yes** GO to N4 . **No** INSTALL a new rear view mirror. REFER to Section 501-00 . TEST the system for normal operation.

<table>
<tr><th>N4 CHECK THE VEHICLE ACCURACY</th><th></th></tr>
<tr><td>
• Position the vehicle and observe the compass display as follows:
<table>
<tr><th>Direction</th><th>Compass Display</th></tr>
<tr><td>North</td><td>N</td></tr>
<tr><td>Northeast</td><td>NE</td></tr>
<tr><td>East</td><td>E</td></tr>
<tr><td>Southeast</td><td>SE</td></tr>
<tr><td>South</td><td>S</td></tr>
<tr><td>Southwest</td><td>SE</td></tr>
<tr><td>West</td><td>W</td></tr>
<tr><td>Northwest</td><td>NW</td></tr>
</table>
• Does the compass calibrate correctly?
</td><td>
Yes
The compass is operating correctly.

No
INSTALL a new rear view mirror. REFER to Section 501-00 . TEST the system for normal operation.
</td></tr>
</table>

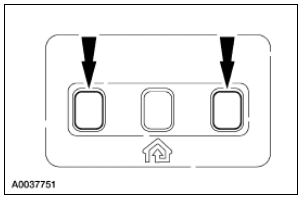
Universal Transmitter Programming Printable View (25 KB)

⚠ WARNING: A garage door opening system that cannot stop or reverse itself after detecting an object in its path does not meet current federal safety standards. To decrease the risk of serious injury or death, do not use this HomeLink® universal transmitter with a door opening system that lacks stop and reverse features as required by federal standards. This includes any garage door opening system manufactured before April 1, 1982.

1. **⚠ CAUTION: During this procedure, the system that you are programming will be made to operate. Make sure that people or objects are clear of the garage door or gate being programmed.**

   Verify the hand-held transmitter is operative.

2. Prepare for programming the universal transmitter by erasing all three channels by holding down the two outside buttons until the red light begins to flash (20-30 seconds). Release both buttons.

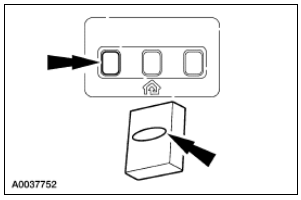


3. Select one of the three universal transmitter channels to be programmed by pressing the desired button.

4. Hold the end of the hand-held transmitter 25-51 mm (1-2 inches) from the front surface of the universal transmitter so that the red light can still be seen.

5. **NOTE:** For Canadian vehicles only: during programming, the hand-held transmitter may automatically stop transmitting after two seconds, which may not be long enough to program the universal transmitter. If programming this type of hand-held transmitter, continue to hold the button on the universal transmitter while re-pressing the hand-held transmitter button every two seconds.

   Use both hands to press the hand-held transmitter button and the desired button on the universal transmitter. Do not release either button.



6. Hold down both buttons until the red light on the universal transmitter flashes, first slowly and then rapidly. Release both buttons when the rapid flashing begins. The universal transmitter has successfully learned the new frequency signal and can be used in place of the hand-held transmitter(s).

7. **NOTE:** If the hand-held transmitter appears to program the universal transmitter but does not open the garage door, the garage door opener may have a code protected or rolling code feature.

To operate, simply press the appropriate button on the universal transmitter. The red light is on while the signal is being transmitted.

Training a Garage Door Opener Equipped With Rolling Codes

8. Program the hand-held transmitter to the universal transmitter. For additional information, refer to Universal Transmitter Programming in this section.

9. Train the garage door opener receiver to recognize the universal transmitter.
    1. Remove the cover panel from the garage door opener receiver.
    2. Locate the training button on the garage door opener receiver. Location and color of the button may vary by garage door opener manufacturer. Refer to the garage door opener instruction manual or owner literature.
    3. Press the training button on the garage door opener receiver for 1-2 seconds.
    4. Press the programmed universal transmitter button for as long as the universal transmitter red light flashes (1-2 seconds). Release the button and re-press the button to confirm that the universal transmitter is trained to the receiver.
    5. The garage door opener should recognize the universal transmitter.

Erasing Channels

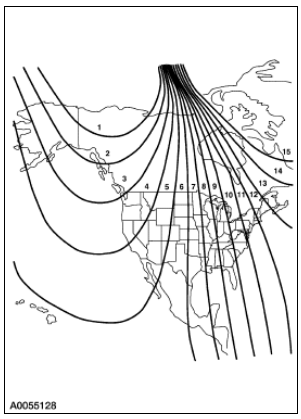
1. **NOTE:** Individual channels cannot be erased, but can be reprogrammed using the procedures for programming; for additional information, refer to Universal Transmitter Programming in this section.

   To erase all three programmed channels, hold down the two outside buttons until the red light begins to flash (20-30 seconds). Release both buttons.

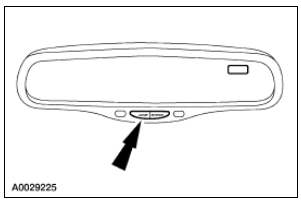
Compass Zone Adjustment

Printable View (52 KB)

1. Refer to the compass calibration zone map to select the correct compass zone setting for your geographical location.



2. With the compass display turned on, press and hold the COMP button (for three seconds) until the display shows the current zone of operation.



3. Release the button.

4. Press the COMP button repeatedly to cycle the zone number display. Set the zone display number to match the vehicle location on the compass calibration zone map.

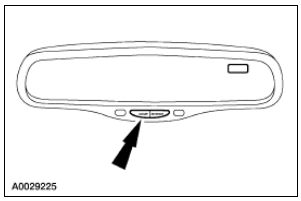
5. Releasing the switch for 10 seconds will exit the zone setting mode.

Compass Calibration

Printable View (15 KB)

1. **NOTE:** For optimum calibration, drive to an open, level location away from large metallic objects or structures. Switch off all non-essential electrical accessories (rear window defrost, heater, A/C, map lamps and wipers) and make sure all doors are shut.

   Press and hold the COMP button until C or CAL is displayed (six seconds). Release the COMP button.



2. Drive the vehicle at less than 8 km/h (5 mph) in a continuous circle until the compass heading is shown.

3. If the C or CAL message does not turn off within five circles, demagnetize the vehicle. Refer to Vehicle Demagnetizing in this section.

Vehicle Demagnetizing

Printable View (10 KB)

⚠ CAUTION: During demagnetizing, the demagnetizer coil will be pulled toward the vehicle. Place a cloth over the vehicle roof to protect the vehicle surface if contact occurs. Make sure the cloth covers the front third and the entire width of the roof.

NOTE: The demagnetizing process requires the use of a demagnetizing coil commonly used by television repair technicians to demagnetize television tubes.

NOTE: To demagnetize, use a constant circular motion over the vehicle roof. Do not turn off the demagnetizer while sweeping the vehicle roof to prevent remagnetizing ferrous materials contained in the vehicle.

NOTE: During the demagnetizing process, make sure the phenolic surface of the tool (the side opposite the handle) is closest to the vehicle surface.

NOTE: Turn the ignition switch to the OFF position.

1. Demagnetize the front third of the vehicle roof.
    1. Turn on the demagnetizer at least 1 meter (3 feet) away from the vehicle.
    2. Holding the demagnetizer no more than 2.5 cm (1 inch) from the roof and starting on the passenger side, demagnetize the front third of the roof closest to the windshield using a constant circular motion. Keep the circles radius within 30 cm (12 inches) while sweeping across the entire surface of the roof closest to the windshield. Continue the circular motion four times.
    3. After the fourth pass and without stopping, move the demagnetizer at least 1 meter (3 feet) away from the vehicle.
    4. Turn the demagnetizer off.
2. **NOTE:** The demagnetizer must be located over the outside of the windshield no greater than 2.5 cm (1 inch).

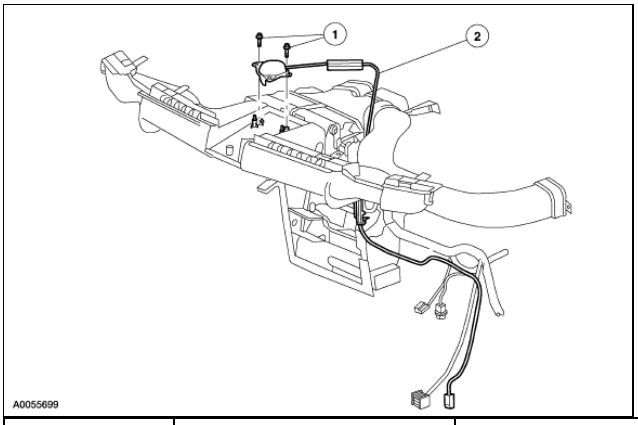
   Demagnetize the inside rear view mirror mounting pad.

    1. Turn on the demagnetizer at least 1 meter (3 feet) away from the vehicle.
    2. Using a circular motion, pass the demagnetizer over the outside of the windshield near the inside rear view mirror mounting pad. Without stopping, move the demagnetizer at least 1 meter (3 feet) away from the vehicle.
    3. Turn the demagnetizer off.
3. Carry out the compass zone adjustment procedure. Refer to Compass Zone Adjustment in this section.
4. Carry out the calibration adjustment procedure. Refer to Compass Calibration in this section.

Global Positioning System (GPS) Antenna

Printable View (55 KB)

1. Disconnect the battery ground cable. For additional information, refer to Section 414-00 .
2. Remove the defroster duct. For additional information, refer to Section 412-00 .
3. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1	N61131-S36	Screws (2 required)
2	10E893-A	GPS antenna and cable

4. To install, reverse the removal procedure.

Navigation System Module

Printable View (74 KB)

1. **CAUTION: Electronic modules are sensitive to electrical charges. If exposed to these charges, damage may result.**

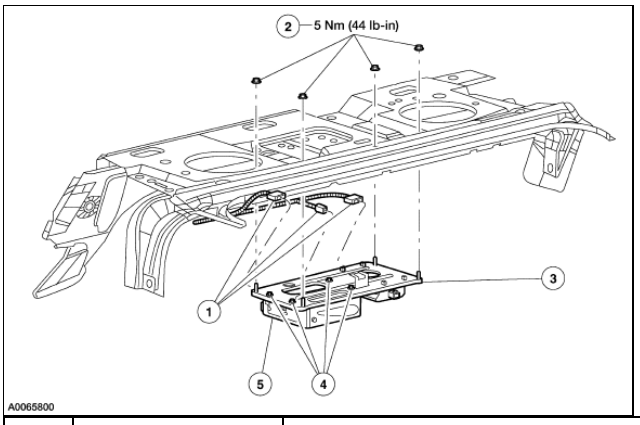
   NOTE: Prior to removal of the navigation system module, it is necessary to remove the digital versatile disc (DVD) from the navigation system module and store it in the customer case.

   Disconnect the battery. For additional information, refer to Section 414-00 .

2. Remove the upper luggage compartment trim panel.

3. Remove the package tray. For additional information, refer to Section 501-01 .

4. Remove the components in the order indicated in the following illustration and table.



Item	Part Number	Description
1	14A005	Electrical connectors
2	N521906 - S309	Nuts (4 required)
3	10E931	Navigation system module and bracket assembly
4	W706919-S900	Navigation system module bolts
5	10E887	Navigation system module

5. To install, reverse the removal procedure.
